Sensors

CE346 – Microprocessor System Design

Branden Ghena – Fall 2023

Northwestern

Administrivia

- Proposal feedback has been greatly delayed
  - Feedback will start tomorrow and will continue through Saturday

- Design presentations will be next week **Tuesday & Thursday**
  - Details are on Piazza: 5 minute presentation
    1. What are you doing
    2. What sensors/actuators are you using
    3. What's the first step you're going to take

  - I'll make a presentation schedule Wednesday or Thursday

Today's Goals

- Think about sensing and sensors

- Explore a variety of sensor types, how they are made, and what their capabilities are

- Discuss an example research platform with a custom sensor

Outline

- **Sensing Overview**

- Types of Sensors
  - Temperature
  - Light
  - Inertial
  - Others

- Capacitive Touch Sensing

Definitions

- A **sensor** is a device that measures a physical quantity
  - Temperature sensor
  - Light sensor
  - Microphone

- An **actuator** is a device that modifies a physical quantity
  - Heater
  - Motor
  - Speaker

Sensors transform quantity into an electric signal

- Microcontrollers can interact with analog signals
  - Generating an analog signal proportional to physical quantity makes the quantity able to be sensed

- How do we generate an electrical signal?
  - Ohm's Law: V = I * R (Voltage = Current * Resistance)
  - Vary any one of these three and an analog signal is created
    - Resistive sensors are common
   - As are sensors that produce a voltage/current

Resistive sensors

$$R = \frac{\rho L}{A}$$

- L: length of the conductor
- A: area of the conductor
- ρ: resistivity of the conductor material

- Various materials have resistivity that is itself a function
  - Based on temperature, light, strain, etc.

Using a resistive sensor

- Place in series with another resistor
  - Between VCC and ground

- Measure voltage between the two relative to ground

- Forms a "voltage divider"
Voltage divider

Important! Learn this

- $V_{out} = \dfrac{R_2}{R_1 + R_2} * V_{in}$
  -
 V_{in} is a voltage source
    - R_1 and R_2 are resistors

- If $R_1 == R_2$
  - $V_{out} = V_{in}/2$

- Smaller R_1 means larger V_{out}
  - V_{out} approaches V_{in}

V_{in}

R_1

V_{out}

R_2

Generating voltage via piezoelectric effect

- Compression of the material generates a voltage

- Various sources of compression:
  - Air Pressure
  - Acceleration
  - Strain

No Pressure

Pressure

V= 0

V> 0

- Alternative to resistive sensors. But, a voltage is still the output
Understanding sensor voltage

- Once you get a voltage, what do you do with it?

- Need to understand the transfer function between voltage and the sensed quantity
  - Examples for an accelerometer: senses acceleration

- Hopefully, function is linear
  - Frequently, function is NOT

Affine sensor model (for linear sensors)

$$F(x) = ax + b$$

- x is the quantity being sensed
- F(x) is a voltage proportional to that quantity

- Parameters
  - a: sensitivity, units Volts/quantity
    - Change in voltage per change in quantity

  - b: bias, units Volts
    - Offset in voltage for zero of the quantity

Bias and sensitivity example

Accel
x(g)

-3.6   0   3.6

$V_{readout}$ (V)
$F(x)$

0   1.5   3.0

$F(x) = ax+b$
$b = 1.5$
$a = 1.5/3.6 = 0.417$ V/g

ADC (16-bit)

[0,3 V] → [0, 2^{16}-1]

0   32768   65535

Understanding transfer function: ADXL330 datasheet

- Ratiometric
  - Relative to sensor voltage

- Bandwidth
  - ≈Data update speed of the sensor
  - Data changes above 1600 Hz are less detectable

SPECIFICATIONS

$T_A = 25°C$, $V_S = 3$ V, $C_X = C_Y = C_Z = 0.1$ μF, acceleration = 0 g, unless otherwise noted. All minimum and maximum specifications are guaranteed. Typical specifications are not guaranteed.

Table 1.

Parameter	Conditions	Min	Typ	Max	Unit
SENSOR INPUT	Each axis				
Measurement Range		±3	±3.6		g
Nonlinearity	% of full scale		±0.3		%
Package Alignment Error			±1		Degrees
Inter-Axis Alignment Error			±0.1		Degrees
Cross Axis Sensitivity[1]			±1		%
SENSITIVITY (RATIOMETRIC)[2]	Each axis				
Sensitivity at X_{OUT}, Y_{OUT}, Z_{OUT}	$V_S = 3$ V	270	300	330	mV/g
Sensitivity Change Due to Temperature[3]	$V_S = 3$ V		±0.015		%/°C
ZERO g BIAS LEVEL (RATIOMETRIC)	Each axis				
0 g Voltage at X_{OUT}, Y_{OUT}, Z_{OUT}	$V_S = 3$ V	1.2	1.5	1.8	V
0 g Offset vs. Temperature			±1		mg/°C
NOISE PERFORMANCE					
Noise Density X_{OUT}, Y_{OUT}			280		μg/√Hz rms
Noise Density Z_{OUT}			350		μg/√Hz rms
FREQUENCY RESPONSE[4]					
Bandwidth X_{OUT}, Y_{OUT}[5]	No external filter		1600		Hz
Bandwidth Z_{OUT}[5]	No external filter		550		Hz
R_{FILT} Tolerance			32 ± 15%		kΩ
Sensor Resonant Frequency			5.5		kHz

Break + Question

- Accelerometer
  - Measures 0-5 g
  - Over a 0-5v range

- What is sensitivity?

- What is bias?

- What acceleration is the voltage reading 3.5 volts?

$$F(x) = ax + b$$

x is the quantity being sensed

F(x) is a voltage proportional to that quantity

a: sensitivity, units Volts/quantity
 Change in voltage per change in quantity

b: bias, units Volts
  Offset in voltage for zero of the quantity

Break + Question

- Accelerometer
  - Measures 0-5 g
  - Over a 0-5v range

- What is sensitivity?   1 v/g

- What is bias?   0 v

- What acceleration is the voltage reading 3.5 volts?
  - 3.5 v = 1v/g * x + 0v -> 3.5 g

$$F(x) = ax + b$$

x is the quantity being sensed

F(x) is a voltage proportional to that quantity

a: sensitivity, units Volts/quantity
  Change in voltage per change in quantity

b: bias, units Volts
  Offset in voltage for zero of the quantity

Active and passive sensing

Passive Sensing
Active Sensing
Active and passive sensing

- We usually focus on passive sensing
  - Cheaper and lower energy costs!

- Active sensing examples
  - Flash photography
  - Ultrasonic distance sensing
  - Lidar and Radar

Intelligent sensors

- Many embedded sensors are more intelligent than simple analog

- Combine it with a built-in ADC
  - Can be more finely tuned and calibrated for accuracy
  - Now gives digital output over some wired communication mechanism

- Combine it with additional circuitry / computation
  - Automatically filter data
  - Detect specific signal patterns and interrupt

- I point most groups at intelligent sensors for projects
  - More expensive but easier to use

Outline

- Sensing Overview

- **Types of Sensors**
  - **Temperature**
  - Light
  - Inertial
  - Others

- Capacitive Touch Sensing

Digital temperature sensor

- **Thermostat**
  - Original meaning of the word

- Heat bends a strip of two different metals
- Switches circuit on/off based on the temperature

Electrical connection

Bi-metallic strip

Electrical Contacts Closed

Higher Metal Strip
Lower Metal Strip

Electrical Contacts

Electrical connection

Electrical Contacts open due to Heat

Contact Movement

Open circuit condition

Fixed Point

HEAT
Thermo-electric temperature sensing

The voltage output being the temperature difference between the two dissimilar junctions ($V_{out} = V_1 - V_2$)
- **Thermocouple** generates a voltage based on temperature

- Can be used to harvest energy to run system
  - Part of RTG design

Resistive temperature sensing

- **Thermistor** varies resistance based on temperature

- Set up as a voltage divider to measure

- Advantages: extremely cheap and easy to use

- Disadvantages: non-linear transfer function
Outline

- Sensing Overview

- **Types of Sensors**
  - Temperature
  - **Light**
  - Inertial
  - Others

- Capacitive Touch Sensing

Measuring light

- Lux: unit of illuminance

- Beware spectrum sensitivity

Relative Spectral Response

RELATIVE RESPONSE - %

(graph: relative response vs wavelength in nm, peaking near 100% around 550-600 nm, dropping off after 700 nm)

WAVELENGTH - nm

Illuminance	Example
0.002 lux	Moonless clear night sky
0.2 lux	Design minimum for emergency lighting (AS2293).
0.27 - 1 lux	Full moon on a clear night
3.4 lux	Dark limit of civil twilight under a clear sky
50 lux	Family living room
80 lux	Hallway/toilet
100 lux	Very dark overcast day
300 - 500 lux	Sunrise or sunset on a clear day. Well-lit office area.
1,000 lux	Overcast day; typical TV studio lighting
10,000 - 25,000 lux	Full daylight (not direct sun)
32,000 - 130,000 lux	Direct sunlight

Resistive light sensing

- **Photocell** changes resistance with light (non-linear)

Electrodes

Cold weld contacts

Ceramic

Photoconductive material over top surface

Wire terminals

ABSOLUTE MAXIMUM RATING (TA)= 23°C UNLESS OTHERWISE NOTED

SYMBOL	PARAMETER	MIN	MAX	UNITS
V_{pk}	Applied Voltage		150	V
$P_{d\ \Delta po/\Delta t}$	Continuous Power Dissipation		100	mW/°C
T_O	Operating and Storage Temperature	-30	+75	°C
T_S	Soldering Temperature*		+260	°C

* 0.200 inch from base for 3 seconds with heat sink.

ELECTRO-OPTICAL CHARACTERISTICS RATING (TA)= 23°C UNLESS OTHERWISE NOTED

SYMBOL	CHARACTERISTIC	TEST CONDITIONS	MIN	TYP	MAX	UNITS
R_D	Dark Resistance	After 10 sec. @ 10 Lux @ 2856 °K	0.2			MΩ
R_I	Illuminated Resistance	10 Lux @ 2856 °K	3		11	KΩ
S	Sensitivity	LOG(R100)-LOG(R10)** / LOG(E100)-LOG(E10)***		0.6		Ω/Lux
λrange	Spectral Application Range	Flooded	400		700	nm
λpeak	Spectral Application Range	Flooded		520		nm
t_r	Rise Time	10 Lux @ 2856 °K		55		ms
T_f	Fall Time	After 10 Lux @ 2856 °K		20		ms

**R100, R10: cell resistances at 100 Lux and 10 Lux at 2856 °K respectively .
***E100, E10: luminances at 100 Lux and 10 Lux 2856 °K respectively.
Kit version:
- 10 kΩ when dark
- 1 kΩ when light
Photodiodes leak current based on light levels

- When voltage is applied in reverse to an ideal diode, no current flows

- But some small amount of current leaks for real-world diodes
  - Proportional to light levels!

- LEDs can be used as (crappy) photodiodes as well!
  - Apply reverse voltage
  - Read in leak current as voltage across a resistor using ADC

https://wiki.analog.com/university/courses/electronics/electronics-lab-led-sensor
Light color sensing

- Respond to specific light colors separately

PHOTODIODE SPECTRAL RESPONSIVITY RGBC

- Intelligent sensor: photodiodes combined with ADCs and a wired interface (I2C)
- Allows interrupting based on comparator too

Passive Infrared (PIR) sensor

- Detect movement in the environment
  - By detecting change in IR levels

- Often come with plastic lens cover to improve field of view and range
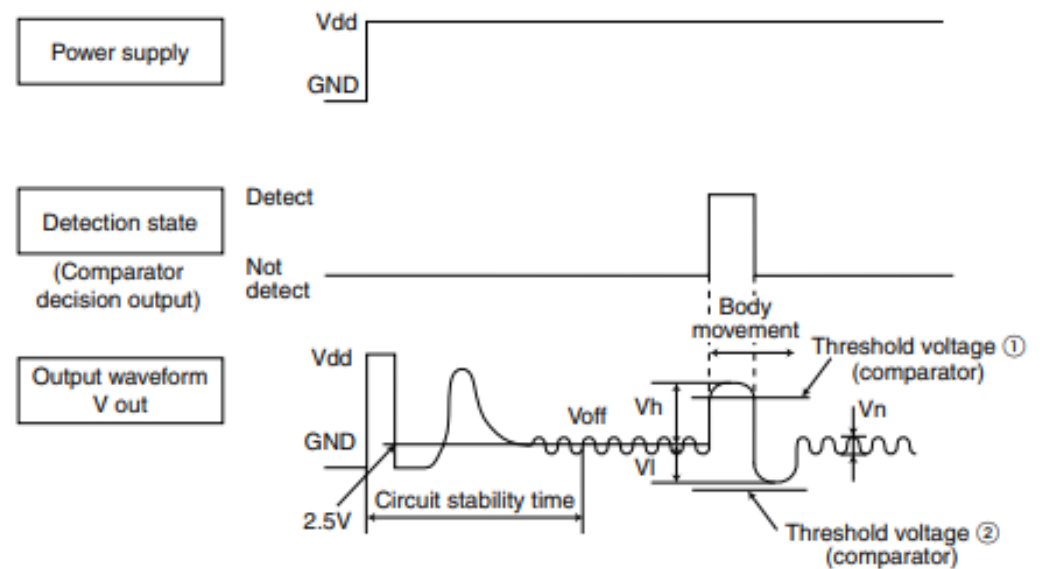

PIR sensors come in digital and analog forms
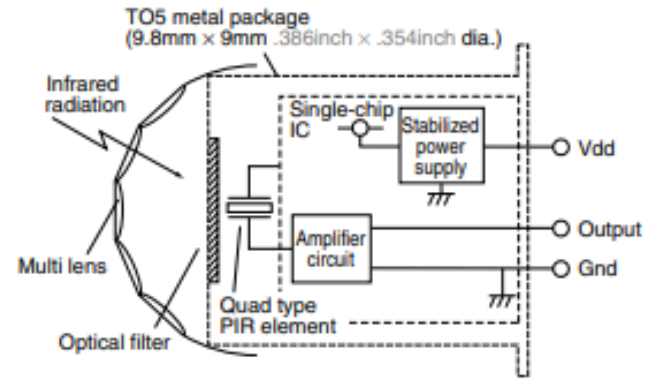

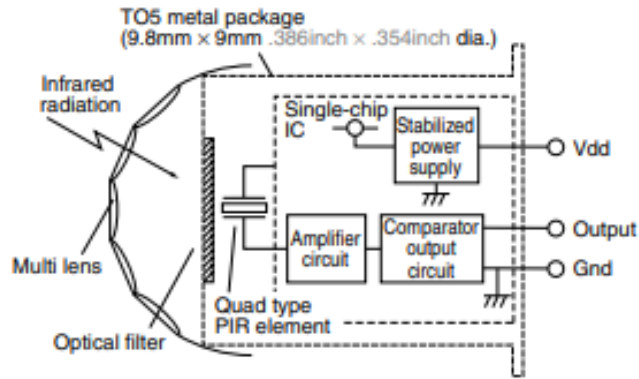

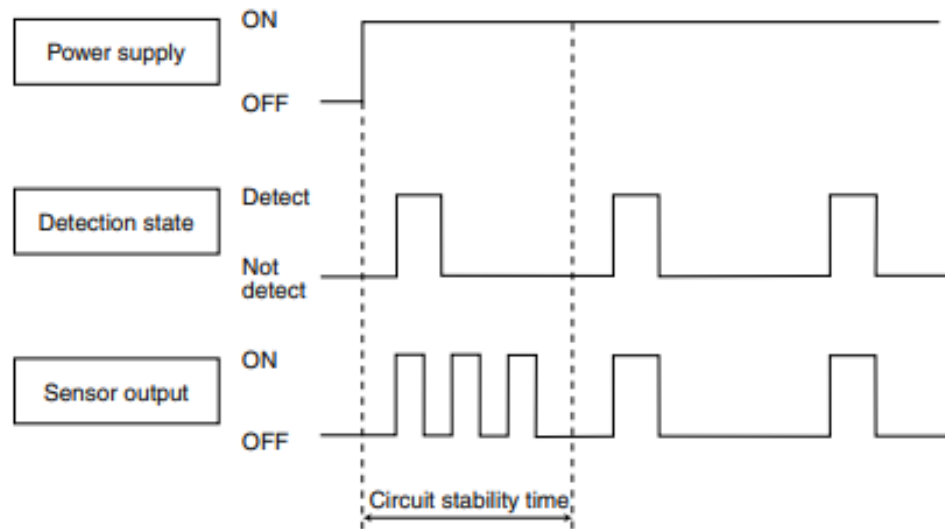

Digital includes a preconfigured comparator

Outline

- Sensing Overview

- **Types of Sensors**
  - Temperature
  - Light
  - **Inertial**
  - Others

- Capacitive Touch Sensing

Inertial Measurement Unit (IMU)

- IMUs (a.k.a 9 degree-of-freedom, 9DOF) are used for tracking motion of a device
    - Acceleration (X, Y, Z axes)
    - Rotation (X, Y, Z axes)
    - Magnetism (X, Y, Z axes)

    - Sometimes 6DOF with Acceleration + one of the others

- Intelligent sensing: combines multiple sensors, ADCs, and computation with a wired interface
    - 9 analog inputs would otherwise be too many

- Can be used to track motion, determine transportation method
    - Smartphones, Robotics, etc.

Sensing acceleration

- Goal: create a voltage that changes based on force

Capacitive accelerometer — www.explainthatstuff.com
1. Mass presses capacitor plate
2. Mass closes plates, changing capacitance

Piezoelectric accelerometer — www.explainthatstuff.com
2. Mass squeezes crystal
1. Mass presses against crystal
3. Squeezed crystal generates voltage
Microelectromechanical Systems (MEMS)

- Same concept, but within an IC and 1 to 100 micrometers in size

MEMS Accelerometer
Using accelerometers

- Accelerometers usually measure in g's
  - Where 1 g equals acceleration due to Earth gravity

- Determining distance from acceleration is possible
  - But messy. Error is squared when integrating
  - Needs careful filtering and is only accurate over short periods
  - Often fills in gaps between GPS samples (or other localization systems)

- Accelerometers also work as tilt sensors
 - Constantly sensing pull of gravity
  - $A[x] = 1\,g\,*\,\sin(\theta)$
Gyroscopes

- Measures angular velocity
  - Usually lower limit than you might hope
  - <10 rotations per second

- Usually, we want angle instead of rotation speed
  - Integrate signal to determine current angle
  - Combine noise and DC bias with integration and you get a continuously accumulating error: drift
Magnetometer

- Measures the magnetic field

- Usually used in devices as a compass
  - Detect Earth's magnetic field orientation

- Problem: Earth's magnetic field often overwhelmed by local magnetism when indoors
  - Large chunks of metal in walls, for example
  - Or other metal parts nearby on the circuit board!!

- Satellites can use magnetometers for localization
Outline

- Sensing Overview

- **Types of Sensors**
  - Temperature
  - Light
  - Inertial
  - **Others**

- Capacitive Touch Sensing

Other sensors

- Environment: Pressure, Humidity, Air Velocity, Air Quality

- Distance: Ultrasonic, Lidar, or Radar

- Biometric: Pulse Oximeter, Heart Rate

- Agricultural: Soil moisture
Break + Open Question

How are new sensors discovered/created?

Outline

- Sensing Overview

- Types of Sensors
  - Temperature
  - Light
  - Inertial
 - Others

- **Capacitive Touch Sensing**

Capacitive Touch Sensor

- Pull-up resistors connected to metal pads
  - Also connected to GPIO pin

- Acts as a capacitor connected to ground
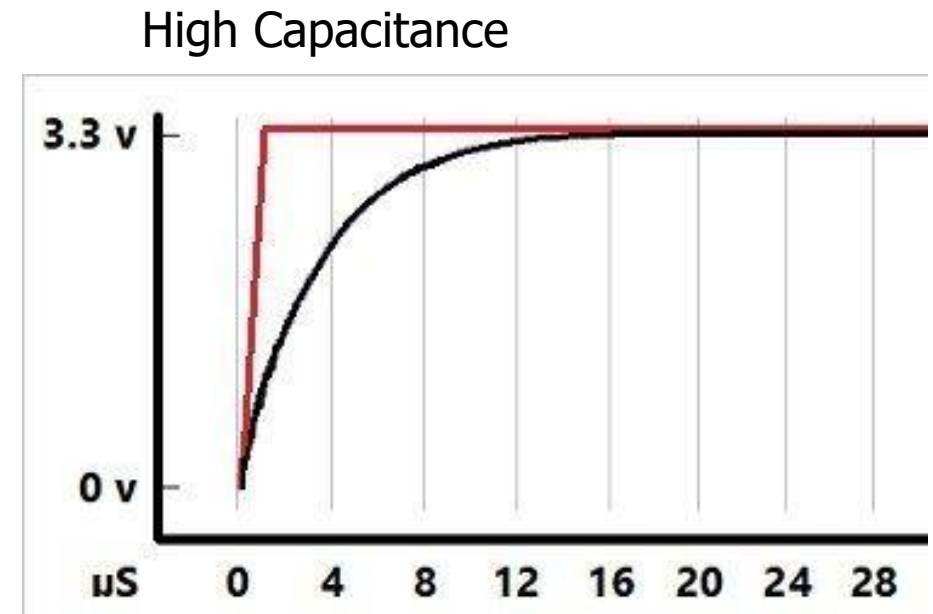

The touch pad recharges on its own

- If you drive the GPIO pin attached to it low, touchpad clears low

- If you make the GPIO pin an input (high impedance)
  - The touchpad gets pulled high, which takes some amount of time

Low Capacitance
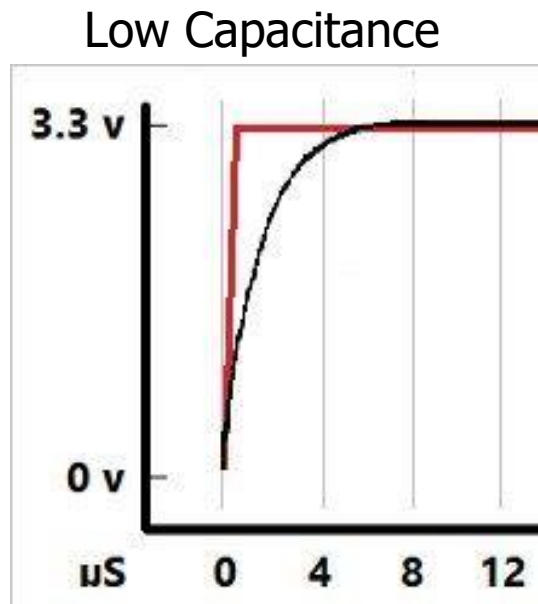

High Capacitance

The more capacitance the longer this takes!

And fingers are GIANT capacitors

Capacitive touch sensing method

1. Drive GPIO pin low
   - Connects the pad to ground

2. Set GPIO pin as input and enable low-to-high interrupt
   - Gets an interrupt when the pad finally becomes high on its own
   - Use a timer to determine time until interrupt
     - ~70 µs with no finger, <= milliseconds with finger
   - Needs to timeout after a few milliseconds to declare "touched" as there might be enough capacitance to *never* go fully high

3. Repeat periodically (a few times a second is probably good enough)

Sudden large increase in rise time ⇨ someone is touching!
   - Finger acts as a large capacitor

Capacitive touch works on any metal surface

- Idea: Microbit door handle sensor

- Connect a wire and a pull-up resistor to a metal door handle to sense when someone is touching it!
  - Timing will be very different from capacitive pad, but should be repeatable and capable of distinguishing human touch

Outline

- Sensing Overview

- Types of Sensors
  - Temperature
  - Light
  - Inertial
  - Others

- Capacitive Touch Sensing

Bonus

- **Research case study**

PowerBlade current sensing

- Example of creating a custom sensor

- PowerBlade goals
  - Sense current and voltage in real-time
  - Be small enough to be deployable

- Problem
  - To measure current, you *usually* have to break the circuit
 - But PowerBlade attaches in parallel

Measuring current

- Coil of wire in a changing electric/magnetic field produces a voltage

- One way to make inductors is as a coil of wire wrapped horizontally around a magnetic core

- Re-purpose horizontally wire-wound inductor as current sensor!
Sensor placement

- Is in the middle or close to a prong the best choice?

- Turns out it's closer to a prong
  - Decreases with distance squared

- Angled like the magnetic field is
Measuring sensor values

- Sensor output is very small

- Amplify to make output large enough to accurately measure with ADC

- Need to pick sampling rate
  - AC: 60 cycles per second in US
  - Need N * 60 measurements per second
  - N=42 (as fast as we can measure)
    - 2520 measurements per second
Current Sense

At first, our output signal was this green line

Blender - 115W, PF=0.50

Resistive Load - 250W, PF=1.00

Time
Actual Current --------
Measured Current ———

I_{SENSE} ———
Absolute Error ———

Measurement into current

- Search coil measures the derivative of current!!

- Need to integrate to get signal and apply sensitivity and bias

$$Current \approx \int \left(\frac{V_{CC}}{2} + \alpha \frac{dI}{dt} \right) dt \approx \alpha I + \beta$$
