Lecture 10
Prototyping

CE346 – Microprocessor System Design
Branden Ghena – Spring 2021

Some slides borrowed from:
Josiah Hester (Northwestern), Prabal Dutta (UC Berkeley), Project Lead The Way

Administrivia

- Quiz 2 due tonight

- Reminder on my office hours today:
  - After class 11-12
  - Normal office hours 1-2

Today's Goals

- Discuss issues to consider when prototyping systems

- Understand how to use breadboards for prototyping

- Explore various components and how you might use them with a breadboard

Outline

- **Overview of Prototyping**

- Breadboarding Components
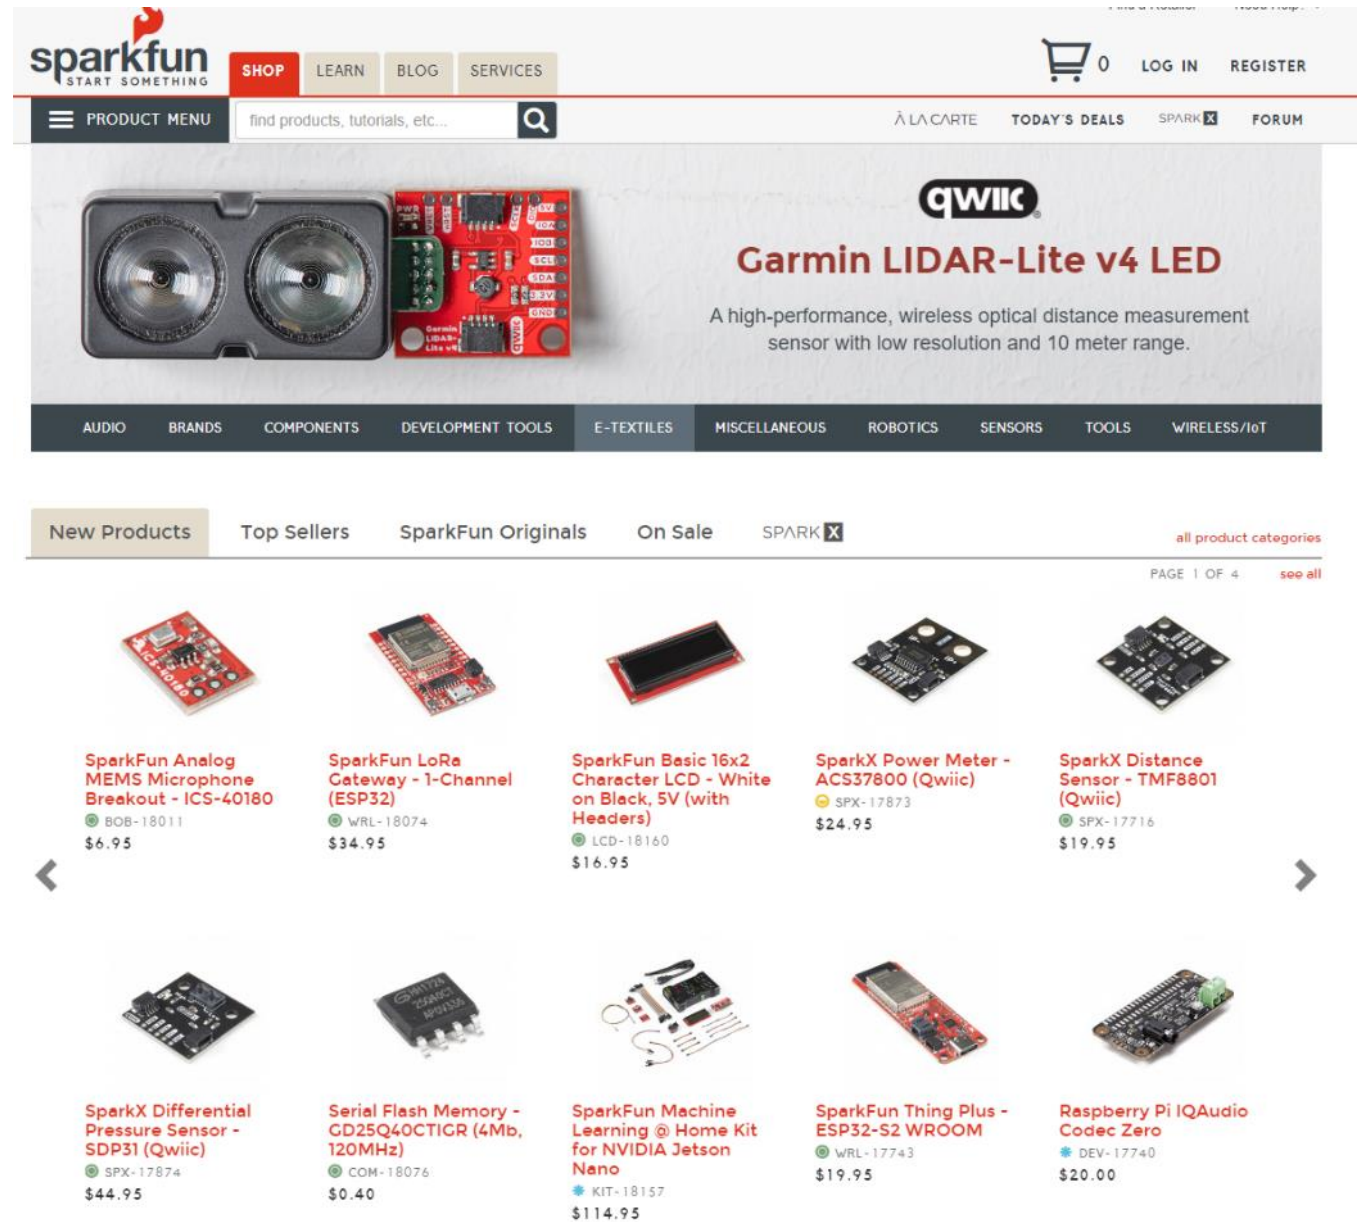

Prototyping goals

- Does this thing work at all?
    - Particular IC
    - Circuit layout
    - Software design
    - etc.

- Sometimes before doing something more serious with it
    - Design a PCB, Make a product, etc.

    - Not uncommon that the prototype is as far as you'll get

Isolating tests

- The goal when prototyping is to isolate the question at hand

- Do consider
  - New sensor/IC/component/whatever

- Do not consider
  - Power
  - Interference
 - Enclosure
  - Stable microcontroller
  - Soldering skills

Buying Parts

- Prototyping vendors
  - Where you look for cool stuff to buy
  - Sparkfun
  - Adafruit

- Electronics vendors
  - Where you buy parts when you know what you need
  - Digikey
  - Mouser
Prototyping methods

- Breadboarding
  - Plug and connect components as needed
  - Build up arbitrarily complex designs from nothing

- Development kits
  - Pre-fabricated systems design for testing components

- Small-scale test PCBs
  - Design a PCB that demonstrates the thing you're interested in
    - Making a PCB is less hard than some might think (Eagle, Fritzing, etc.)
   - $20-30 for small, low-speed PCBs from batch services like OSHPark
Breadboards for prototyping

- Reusable platform for temporary circuits
- Plug in jumper wires and through-hold components

How a breadboard works

- Component leads and wires are inserted into holes in the breadboard

- Half-rows of five holes are connected

- Vertical columns are connected for power/ground

Holes to insert wires

Breadboard LED example
- Uses button to control LED

Breadboard guidelines

- Long wires in large bird nests makes debugging very difficult
  - Shorter, constrained wires are easier to understand
  - In this class, we'll only have large jumper wires though…

- Use the minimum jumpers necessary,
 mostly use breadboard for connections

Bad

Better

More permanent breadboards

- Breadboards are also known as "Solderless Breadboards"

- Protoboard allows configurable circuits
  - Solder jumper wires between locations
  - Solder adjacent pads to form connection

- Usually not worth it (just make a PCB)
  - Does solve core problem of breadboards: things getting unintentionally unplugged
When to not use breadboards

- Breadboards work great for digital circuits and simple analog!

- High voltage/current are bad for breadboards
  - Honestly, anything above 12 volts DC shouldn't be in a breadboard
  - Also avoid high-power applications above a few Watts
  - Never put AC in a breadboard

- Sensitive analog circuits
  - Particularly anything sensitive to capacitance may not work right
  - Sets of metal holes with strips connecting them function as capacitors

- Anything in long term use

Outline

- Overview of Prototyping

- **Breadboarding Components**

Prototyping with a breadboard

- What kinds of things might you use with a breadboard?

- Jumper wire

- Microbit!

- Resistors/Capacitors

- LEDs

- Buttons/Switches

- Analog Sensors

- Various other through-hole components
  - Transistors, Op-Amps, other ICs

https://www.adafruit.com/product/2975

Jumper wires

- Connect two rows in the breadboard together

- Recommendation:
  - Peel off sets of 2-4 wires and keep them stuck together
 - Often want to run multiple at once

Microbit

- Always connect LED matrix side up

- Breaks out various pins from board
 - Need to consult table to know which pins

Resistors

Carbon Film Resistors

4 Bands

Surface Mount Resistors

Variable Resistors

(potentiometer)
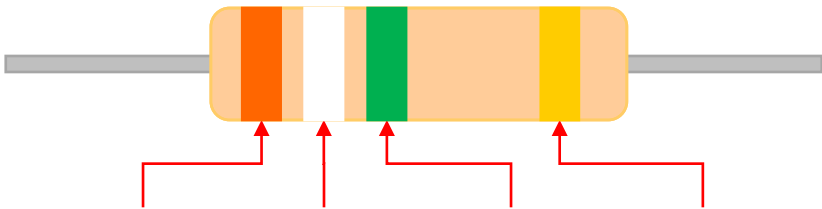

Resistor color codes

- Colored bands on resistors label the resistance value of the part

- First and second bands are the digits

- Third band is multiplier

- Fourth band is tolerance
  - Usually gold: +/- 5%

	1st Band	2nd Band	Multiplier	Tolerance
NONE				20%
Silver			0.01	10%
Gold			0.1	5%
Black	0	0	1	
Brown	1	1	10	
Red	2	2	100	
Orange	3	3	1K	
Yellow	4	4	10K	
Green	5	5	100K	
Blue	6	6	1M	
Violet	7	7	10M	
Gray	8	8	100M	
White	9	9	1000M	

Example: determine the resistor

	1st Band	2nd Band	Multiplier	Tolerance
NONE				20%
Silver			0.01	10%
Gold			0.1	5%
Black	0	0	1	
Brown	1	1	10	
Red	2	2	100	
Orange	3	3	1K	
Yellow	4	4	10K	
Green	5	5	100K	
Blue	6	6	1M	
Violet	7	7	10M	
Gray	8	8	100M	
White	9	9	1000M	

Example: determine the resistor

- 56 x 10 Ω = 560 Ω (±5%)

Potentiometers

- Vary resistance between zero and some maximum
  - 1 kΩ, 10 kΩ, 100 kΩ common

- Connect middle and an edge for just a changeable resistor

- Middle terminal is a movable resistor divider
  - Knob changes middle output if outer pins are VCC and Ground
LEDs

- Directional component: only allows current to flow one way

- Shorter side is the negative one
  - i.e. where current flows to
Larger metal component inside of case or case flat spot is cathode or negative (-) lead

Shorter wire is cathode or negative (-) lead

Negative (-) lead

Schematic Symbol

RGB LED

- Three different colors of LED in a single large diffuser

- Short leads are negative ends
  - One for each color

- Long lead is common power
  - Common anode

- Combinations of LEDs give other colors
  - Cyan, Yellow, Violet, White
