

Lecture 08

Procedures

CS213 – Intro to Computer Systems
Branden Gena – Winter 2022

Slides adapted from:

St-Amour, Hardavellas, Bustamente (Northwestern), Bryant, O'Hallaron (CMU), Garcia, Weaver (UC Berkeley)

Administrivia

- Homework 2 due today
 - Good practice for the exam
 - With slip days, not sure when I can post solutions
- Midterm Exam 1 Tuesday, during class
 - I have already contacted you if you're at a different time
 - Covers material including Tuesday (Control Flow in Assembly)
 - Not today's material
 - 80 minutes to complete (starts at 9:35am sharp)
 - Bring a pencil!
 - Bring one 8.5x11 inch sheet of paper with notes on front and back

Today's Goals

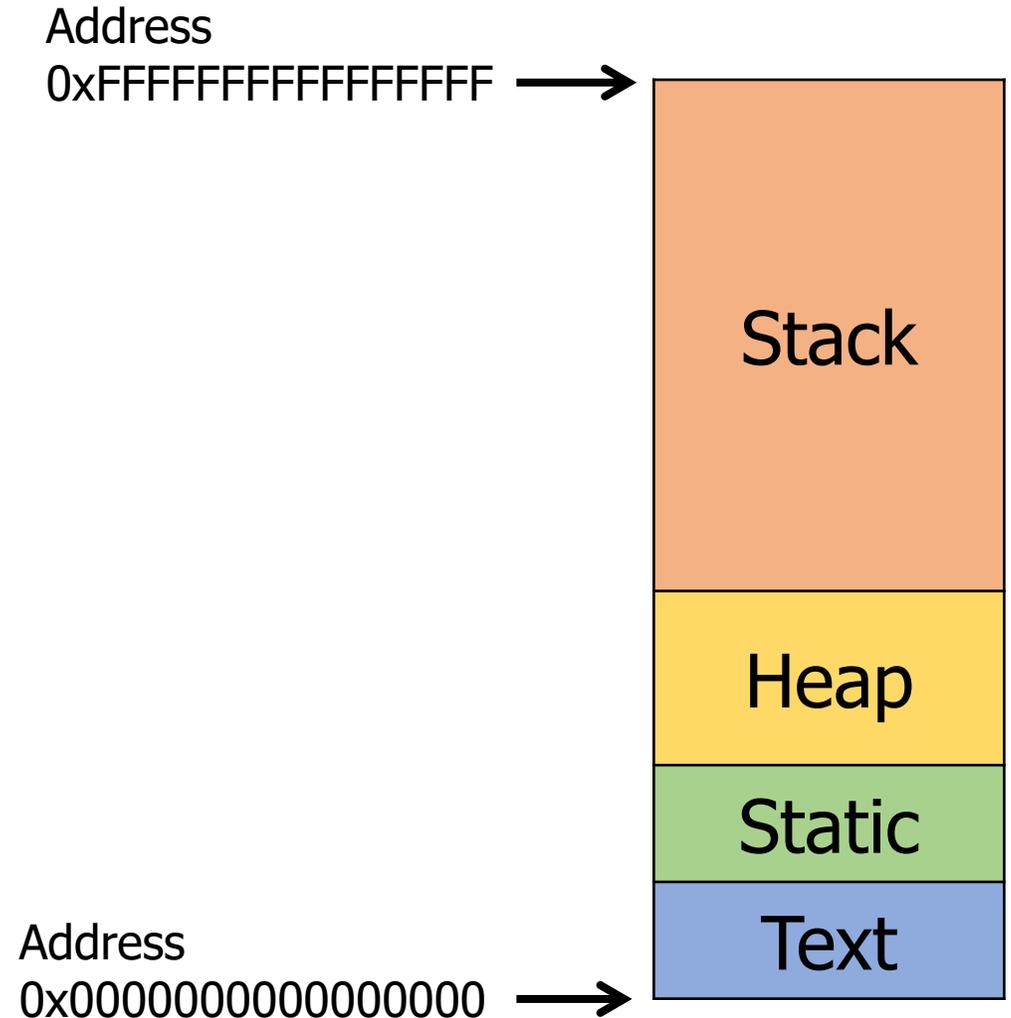

- Describe C memory layout
- Explore functions in assembly
 - How do we call them and return from them?
 - How do we create local variables?
- Understand how we manage register use between functions

Outline

- **C Code Layout**
- x86-64 Calling Convention
- Managing Local Data
- Register Saving
 - Recursion Example

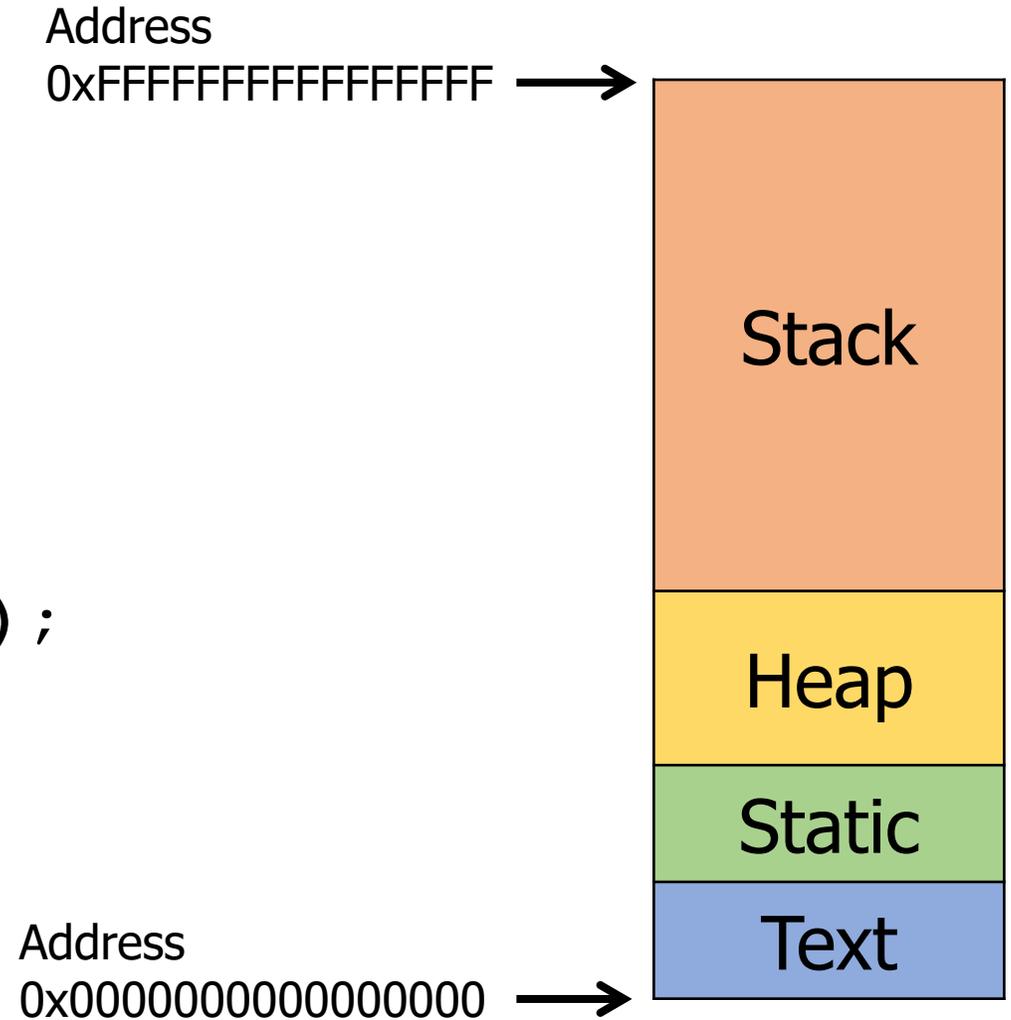

C memory layout

- Stack Section
 - Local variables
 - Function arguments
- Heap Section
 - Memory granted through `malloc()`
- Static Section (a.k.a. Data Section)
 - Global variables
 - Static function variables
- Text Section (a.k.a Code Section)
 - Program code

C memory layout

```
char glob_str[80] = {0};  
void func(short b, int* d) {  
    static int c = 3;  
  
    char* d = "Test";  
    int* e = malloc(sizeof(int));  
  
    printf("Hello CS213\n");  
}
```

C memory layout

```
char glob_str[80] = {0};
```

```
void func(short b, int* d) {
```

```
    static int c = 3;
```

```
    char* d = "Test";
```

```
    int* e = malloc(sizeof(int));
```

```
    printf("Hello CS213\n");
```

```
}
```

Assembly code goes in the Text section

Interacting with data sections in assembly

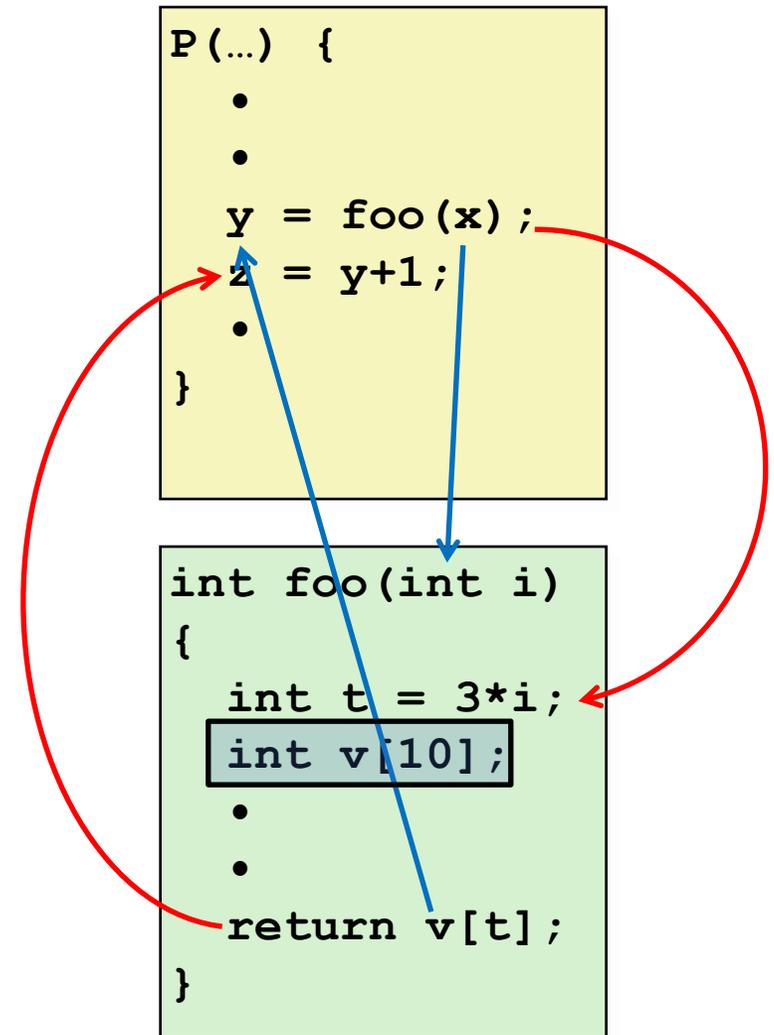

- Stack
 - Stack pointer is saved in `%rsp` and can be moved as needed
 - We'll discuss this today
- Heap
 - C library (malloc) handles this above the machine level
 - i.e. from the machine point of view, there is no heap
- Static
 - Arbitrary pointers to memory can be created and used
 - With memory addressing instructions
 - Assembly directive can place values into Static section
- Text
 - Assembly code is placed here automatically
 - Labels are just addresses within the Text section

Outline

- C Code Layout
- **x86-64 Calling Convention**
- Managing Local Data
- Register Saving
 - Recursion Example

Mechanisms in Procedures

- Passing control
 - To beginning of procedure code
 - Back to return point
- Passing data
 - Procedure arguments
 - Return value
- Local memory management
 - Allocate during procedure execution
 - Deallocate upon return
- No one instruction does all that
 - Need instructions for each
- The stack is the key to all 3 of these!

Procedure control flow

- Use stack to support procedure call and return!

- Procedure call

`callq label` Push return address on stack; jump to `label`

- Procedure return

`retq` Pop address from stack; jump there
(stack should be as it was when the call began)

- Return value is in `%rax`

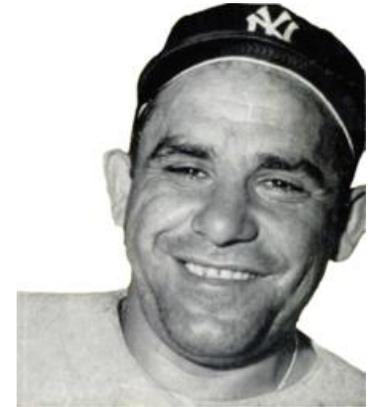

- Return address value

- Address of instruction immediately following `callq`
- Example from disassembly

```
400544: call 400550 <mult2>
400549: mov  %rax, (%rbx)
```

Return address: `0x400549`

Just `call` and `ret` are fine,
the `q` is assumed (there is no other option)

If you don't know where
you're going, you may
not get there.

— Yogi Berra

Code Examples

```
void multstore(long x, long y, long *dest) {  
    long t = mult2(x, y);  
    *dest = t;  
}
```

```
0000000000400540 <multstore>:  
... (we'll fill the start in soon)  
400541: mov     %rdx,%rbx      # Save dest  
400544: callq  400550 <mult2>  # mult2(x,y)  
400549: mov     %rax,(%rbx)    # Store at address dest  
... (we'll fill the end in soon too)  
40054d: retq                   # Return
```

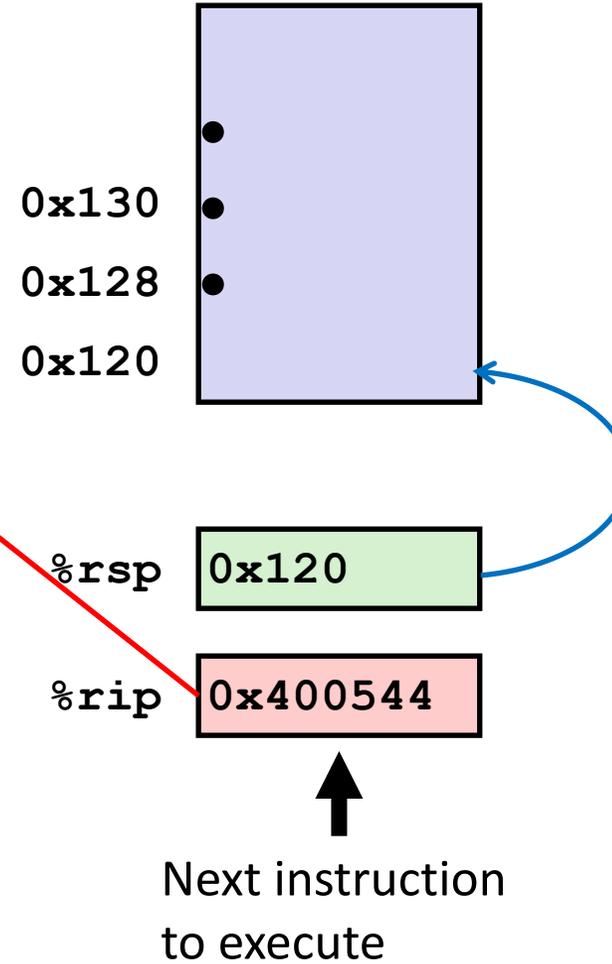

```
long mult2 (long a, long b){  
    long s = a * b;  
    return s;  
}
```

```
0000000000400550 <mult2>:  
400550:  mov     %rdi,%rax      # a  
400553:  imul   %rsi,%rax      # a * b  
400557:  retq                   # Return
```

Control Flow Example about to execute `callq`

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

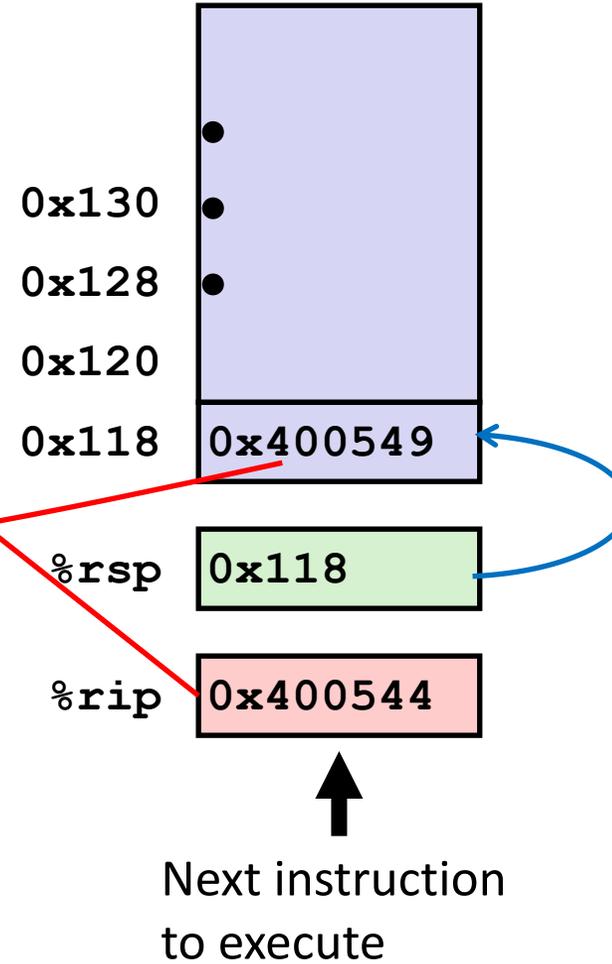

Control Flow Example

callq step 1

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

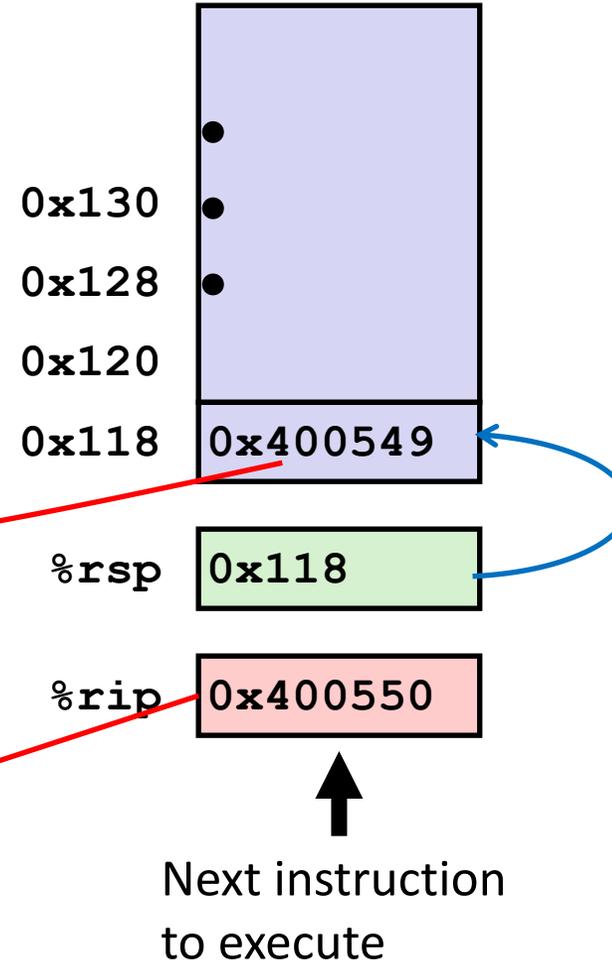

Control Flow Example

callq step 2

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

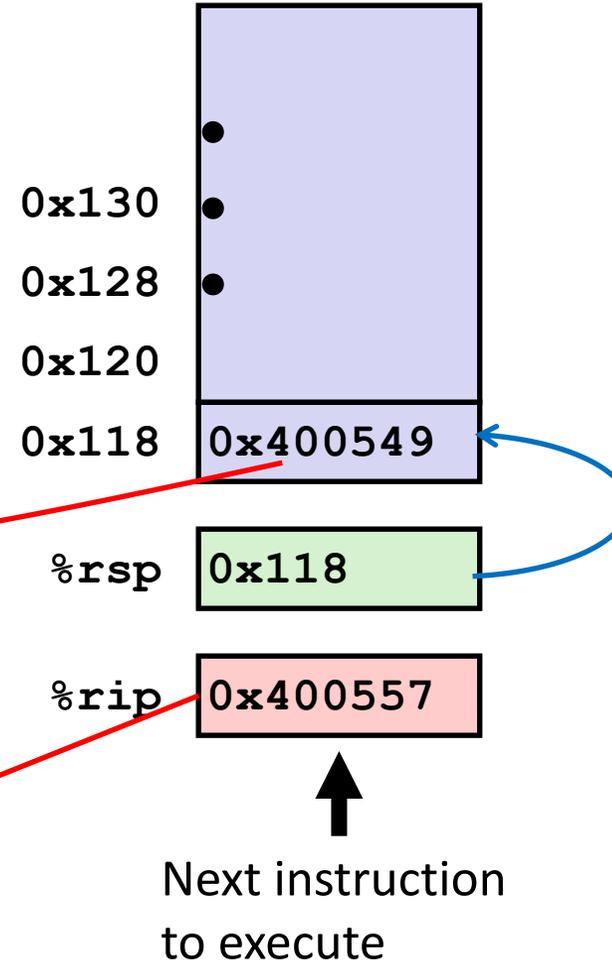

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

Control Flow Example about to execute `retq`

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

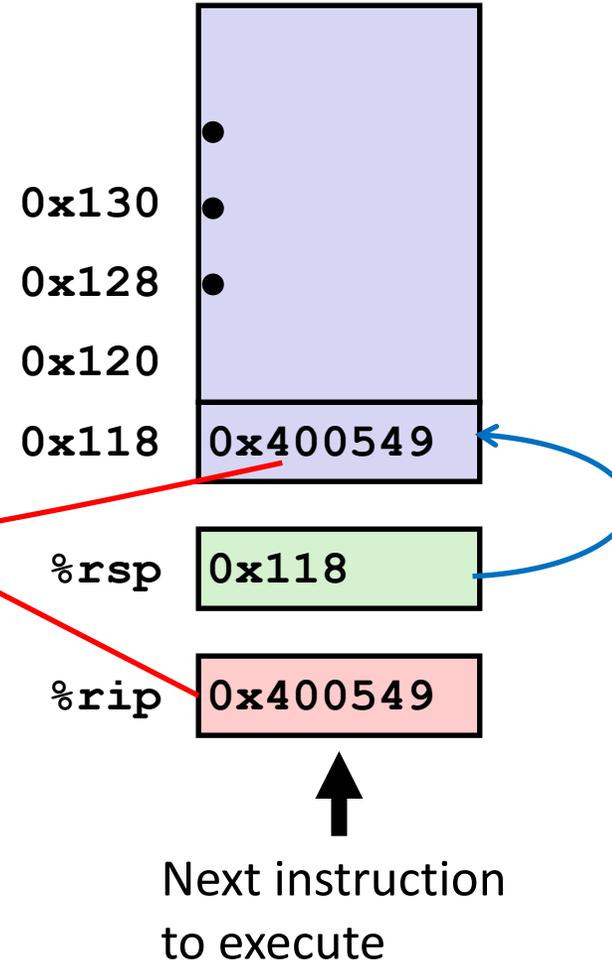

QUIZ: What is the address of the instruction we execute after `retq`?

Control Flow Example

retq step 1

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

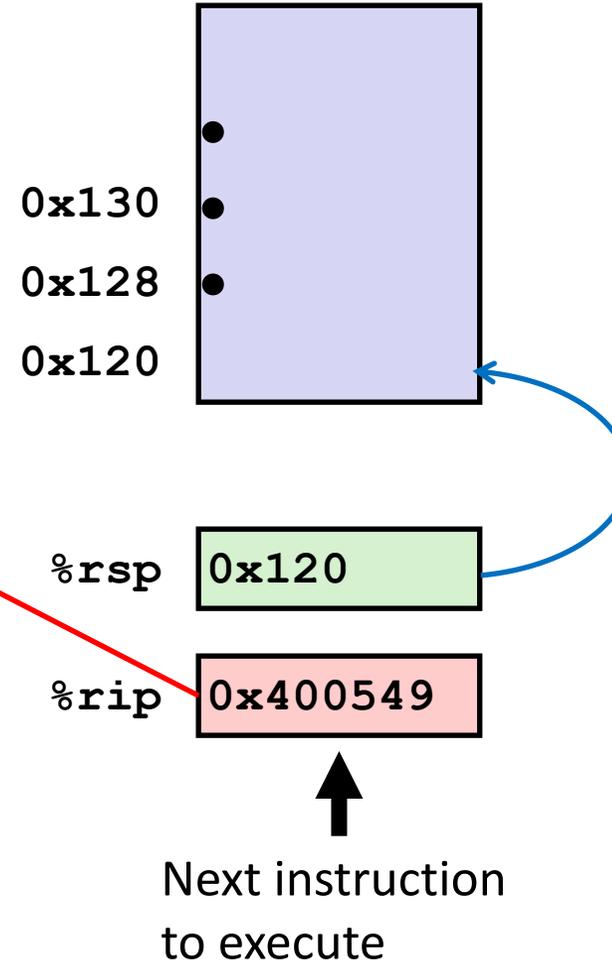

Control Flow Example

retq step 2

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov  %rax, (%rbx)  
.  
.
```

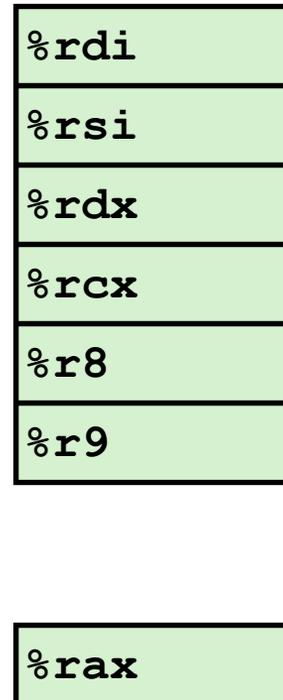

```
0000000000400550 <mult2>:  
400550: mov  %rdi, %rax  
.  
.  
400557: retq
```

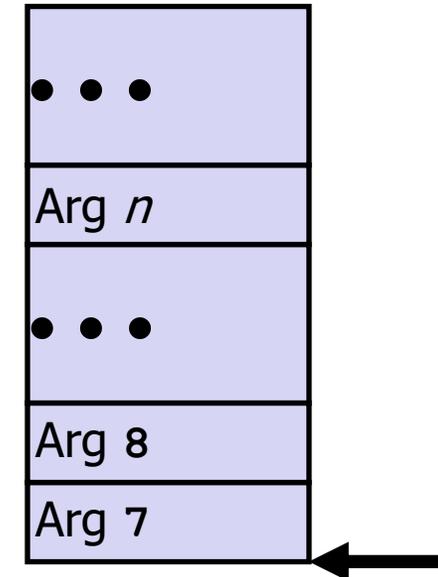

Function data flow

- First 6 arguments are in registers
 - `%rdi` is first argument
- Next `n` arguments are on the stack
 - This means more arguments is slower
- Return value is in `%rax`

Registers

Stack

top

(Only allocate stack space when needed)

Data Flow Examples

```
void multstore (long x, long y, long *dest){
    long t = mult2(x, y);
    *dest = t;
}
```

```
0000000000400540 <multstore>:
```

```
→ # x in %rdi, y in %rsi, dest in %rdx
  ● ● ●
400541: mov    %rdx,%rbx    # Save dest
400544: callq 400550 <mult2> # mult2(x,y)
→ # t in %rax
400549: mov    %rax,(%rbx)   # *dest = t
  ● ● ●
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400550 <mult2>:
  # a in %rdi, b in %rsi ←
400550: mov    %rdi,%rax    # a
400553: imul  %rsi,%rax    # a * b
  # s in %rax ←
400557: retq                    # Return
```

Break + Open Question

- How did we decide how many registers to use for arguments and return values?

<code>%rdi</code>
<code>%rsi</code>
<code>%rdx</code>
<code>%rcx</code>
<code>%r8</code>
<code>%r9</code>

- Do all functions have to use this same convention?

<code>%rax</code>

Break + Open Question

- How did we decide how many registers to use for arguments and return values?
 - Testing lots of real-world programs
 - Many style guides suggest you use four or less arguments
 - x86 (32-bit) only had four arguments
 - x86-64 added two more
 - C only has one return result, so one register is fine
- Do all functions have to use this same convention?
 - All functions within a program must, or they won't work
 - Different programs, or different OSes, could choose different

<code>%rdi</code>
<code>%rsi</code>
<code>%rdx</code>
<code>%rcx</code>
<code>%r8</code>
<code>%r9</code>

<code>%rax</code>

Outline

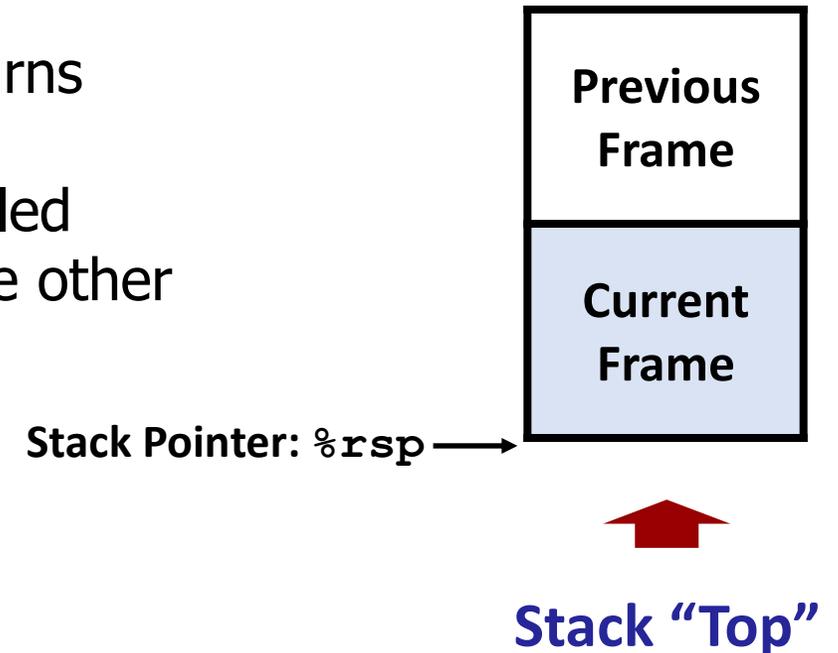

- C Code Layout
- x86-64 Calling Convention
- **Managing Local Data**
- Register Saving
 - Recursion Example

Call-Local State

- Need some place to store state for each call
 - Return address
 - Arguments
 - Local variables
 - Temporary space (if needed)
- Note: these are separate for each call, not each function
 - Function could be called recursively, but each needs its own local variables
- State only needs to exist until the function returns

Using the Stack for Call-Local State

- Place local state on the stack
- Stack discipline
 - That state is only needed for limited time
 - Starts when function is called; ends when it returns
 - ***Callee*** returns before ***caller*** does
 - ***Callee***: for a specific call, the function being called
 - ***Caller***: for a specific call, the function calling the other
- Stack allocated in **Frames**
 - Frame = State for a single procedure invocation
 - Allocated by “setup” code at the start of function
 - Deallocated by “teardown” code before returning

Call Chain Example

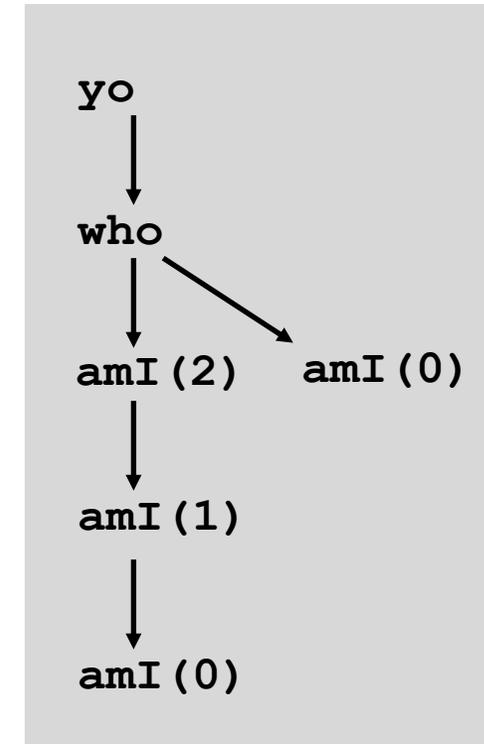

```
yo (...)  
{  
  .  
  .  
  who ();  
  .  
  .  
}
```

```
who (...)  
{  
  . . .  
  amI (2) ;  
  . . .  
  amI (0) ;  
  . . .  
}
```

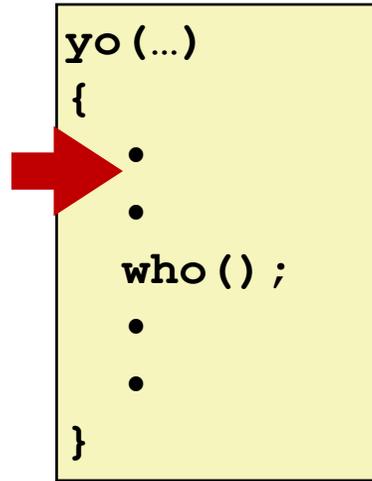

```
amI (int x)  
{  
  .  
  if (x)  
    amI (x-1) ;  
  .  
  .  
}
```

Procedure amI () is recursive

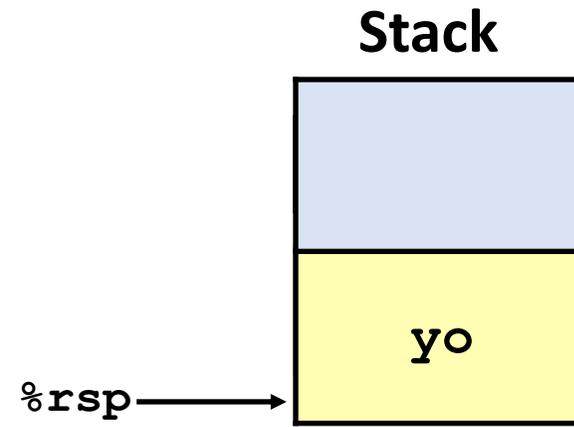

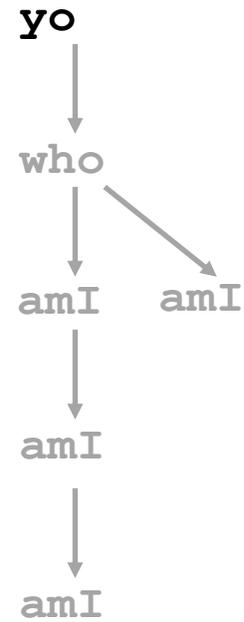

Example Call Chain

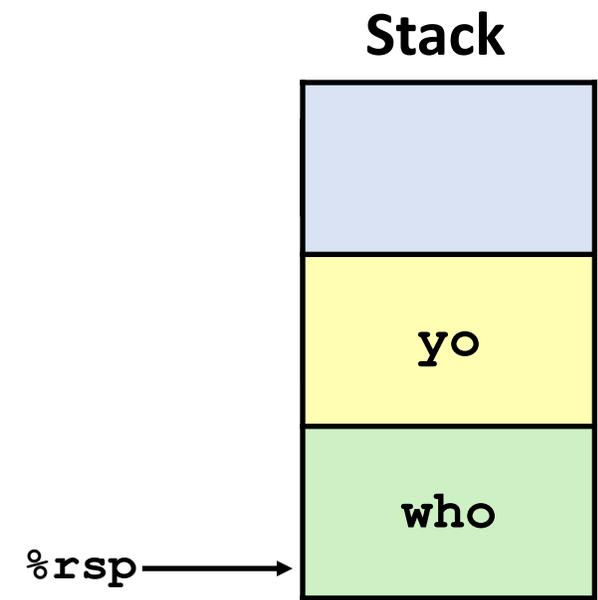

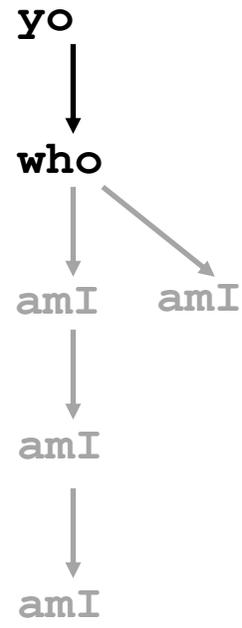

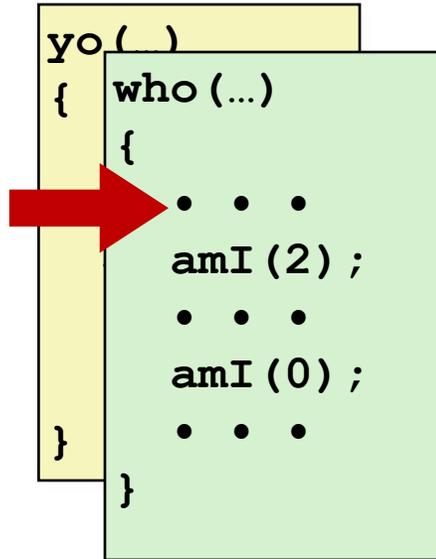

Example

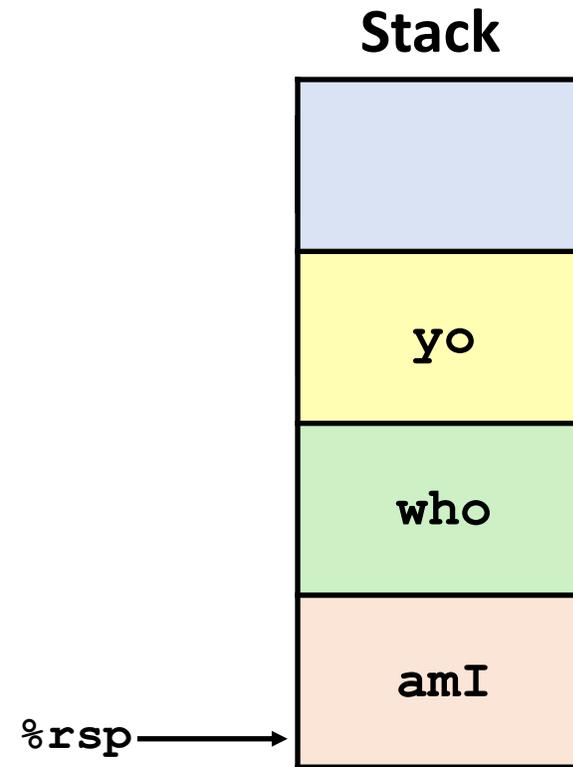

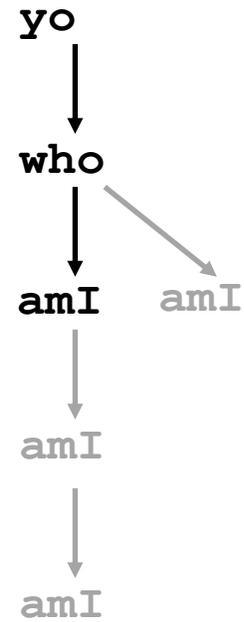

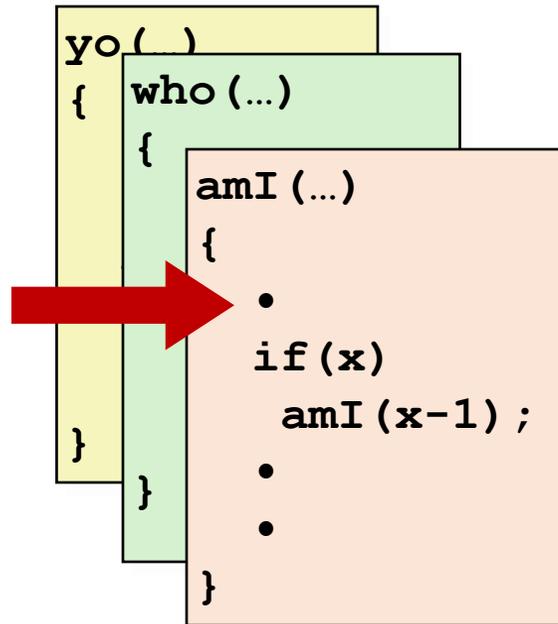

Call Chain

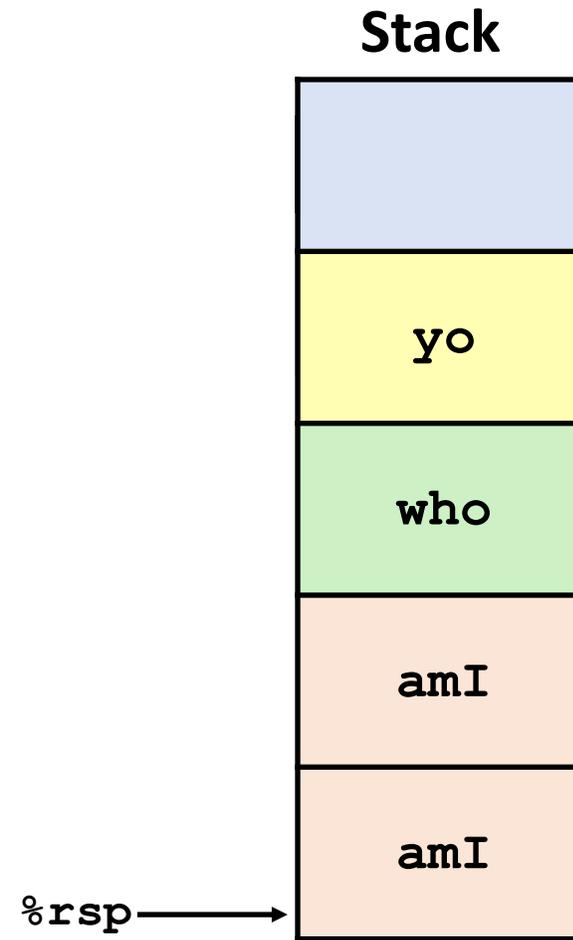

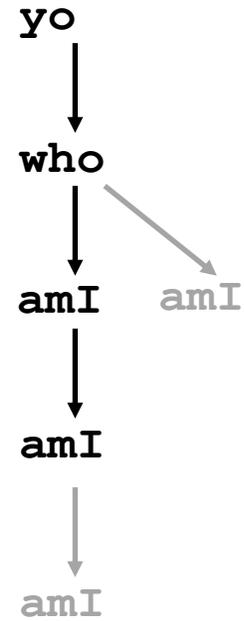

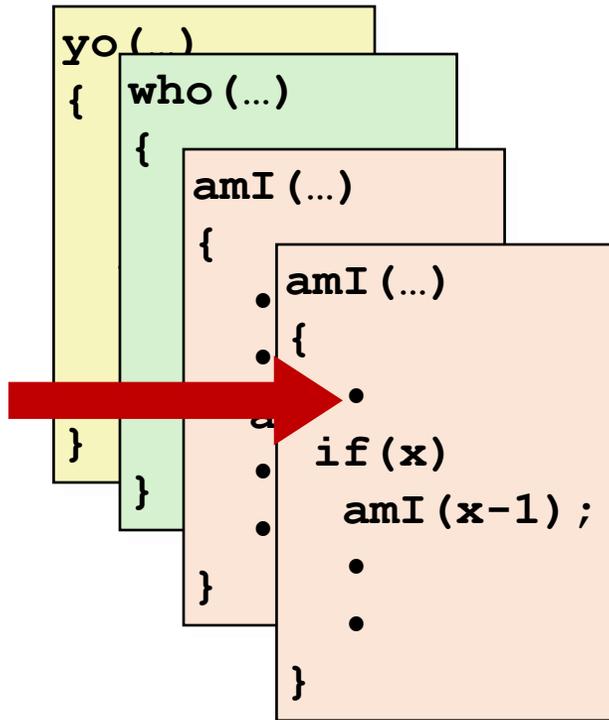

Example

```
yo (...)  
{  
  .  
  .  
  who ();  
  .  
  .  
}
```

x86-64/Linux Stack Frame

- Current Stack Frame (“Top” to Bottom)
 - “Argument build”:
Arguments for function we’re about to call
 - Local variables
If we can’t keep them in registers
(too many, or if must be in memory)
 - Saved register context
(we’ll get to that soon)
- Caller Stack Frame
 - Return address
 - Pushed by `call` instruction
 - Arguments for this call

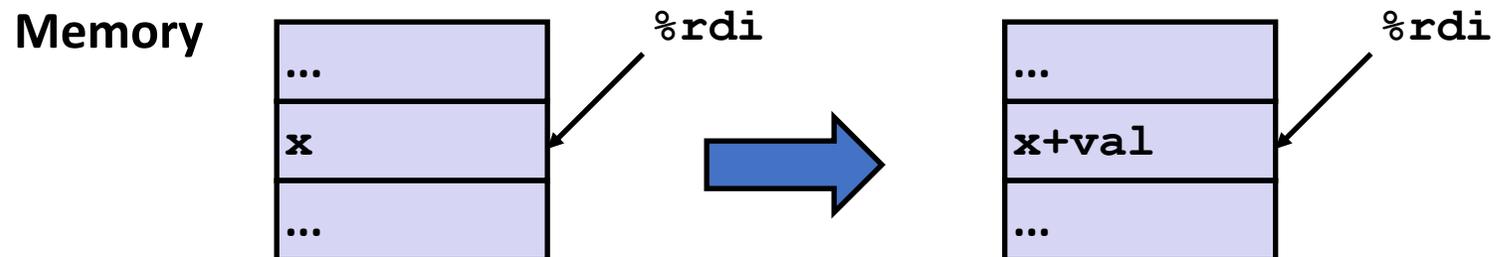

Example: `incr`

```
long incr(long* p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

```
incr:  
    movq    (%rdi), %rax    # x = *p  
    addq    %rax, %rsi     # y = x+val  
    movq    %rsi, (%rdi)   # *p = y  
    ret
```

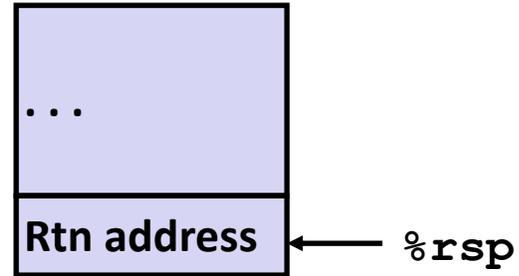

Register	Use(s)
<code>%rdi</code>	Argument <code>p</code>
<code>%rsi</code>	Argument <code>val</code> , also <code>y</code>
<code>%rax</code>	<code>x</code> , Return value

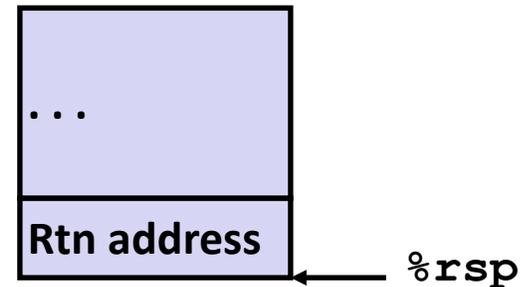

Example: Calling `incr` #1 (local variables)

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

Initial Stack Structure

Resulting Stack Structure

Example: Calling `incr` #1 (local variables)

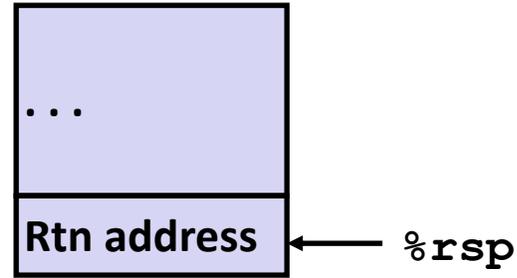

We take `v1`'s address, so must be in memory

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

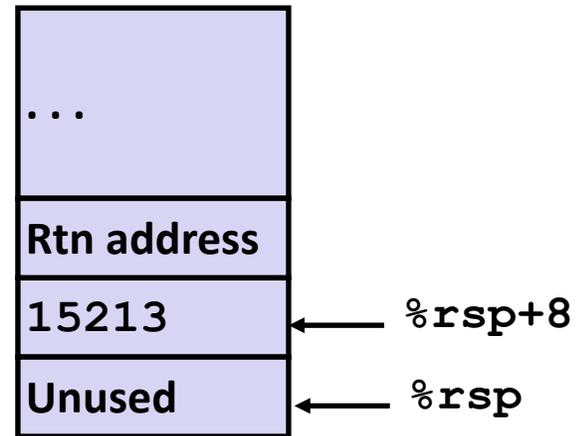

Stack pointer must be multiple of 16

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call   incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Initial Stack Structure

Resulting Stack Structure

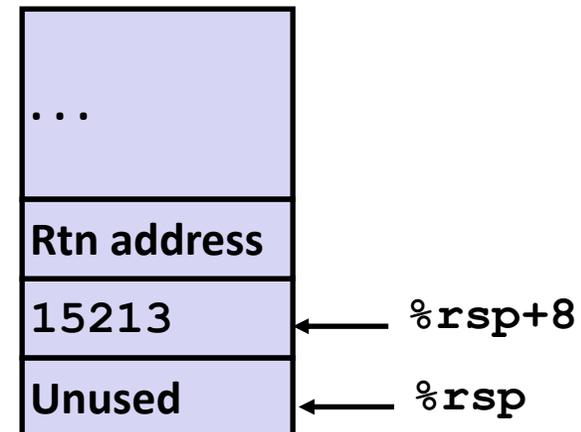

Example: Calling `incr` #2 (argument build)

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	3000

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

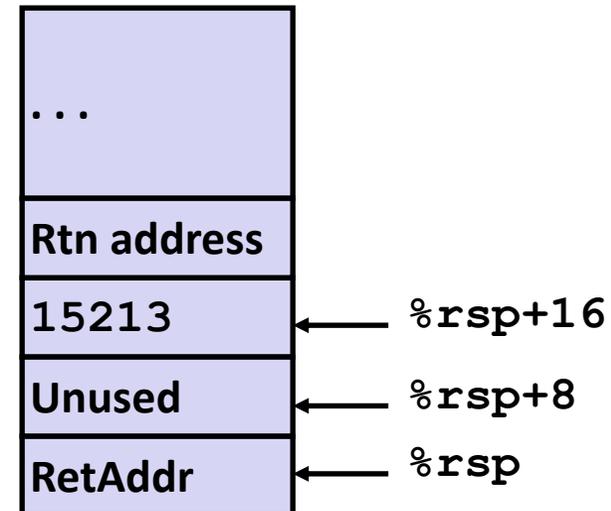

Example: Calling `incr` #3 (control transfer)

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	3000

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Example: executing `incr`

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

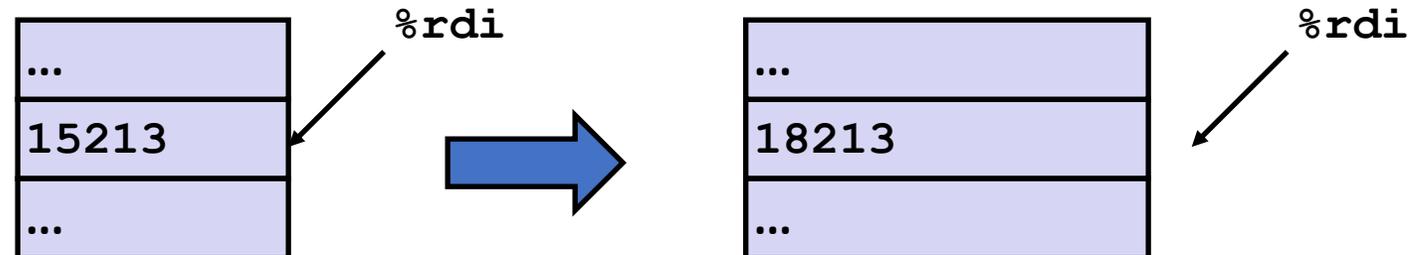

```
incr:  
    movq    (%rdi), %rax  
    addq   %rax, %rsi  
    movq   %rsi, (%rdi)  
    ret
```

Register	Use(s)
<code>%rdi</code>	Argument <code>p</code>
<code>%rsi</code>	Argument <code>val</code> (3000)
<code>%rax</code>	...

Register	Use(s)
<code>%rdi</code>	Argument <code>p</code>
<code>%rsi</code>	18213
<code>%rax</code>	15213 (return value)

Memory

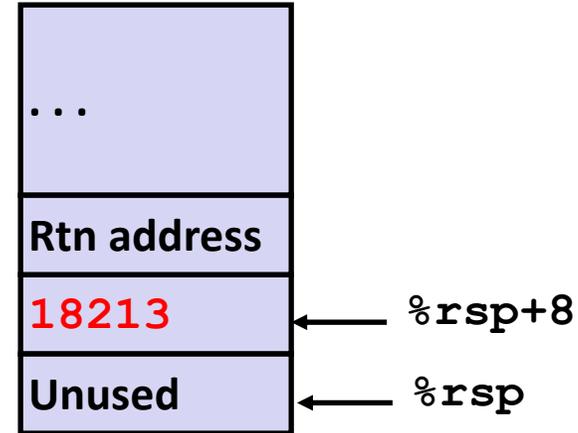

Example: right after executing `incr`

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movq    $3000, %rsi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Stack Structure

Register	Use(s)
%rdi	&v1
%rsi	18213
%rax	15213

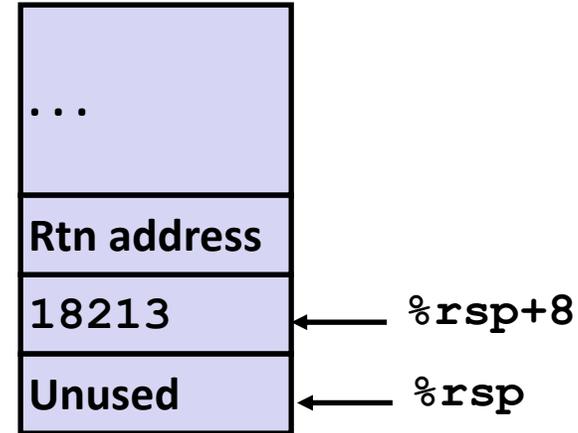

QUIZ: where do we find the return value of `incr`?

Example: Calling `incr` #4 (cleanup)

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

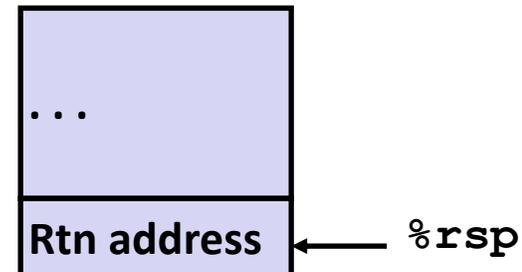

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call   incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Previous stack Structure

Register	Use(s)
<code>%rax</code>	Return value

Updated Stack Structure

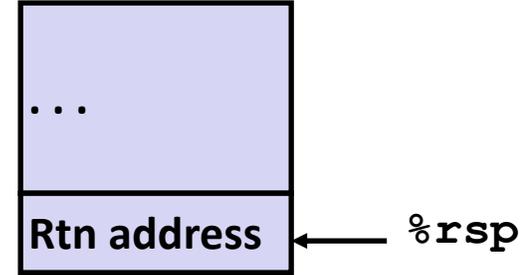

Example: Calling `incr` #5

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

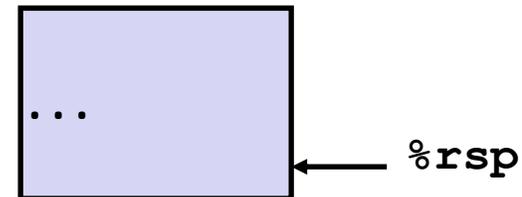

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Updated Stack Structure

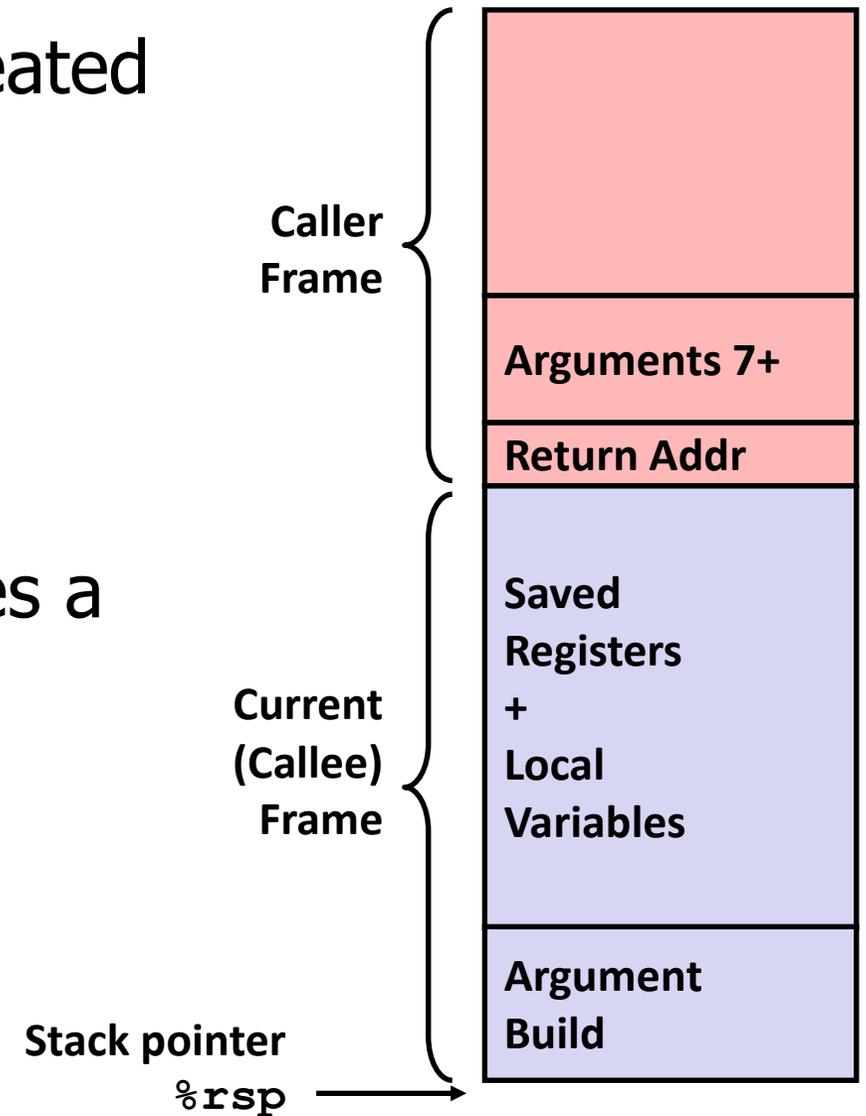

Register	Use(s)
%rax	Return value

Final Stack Structure

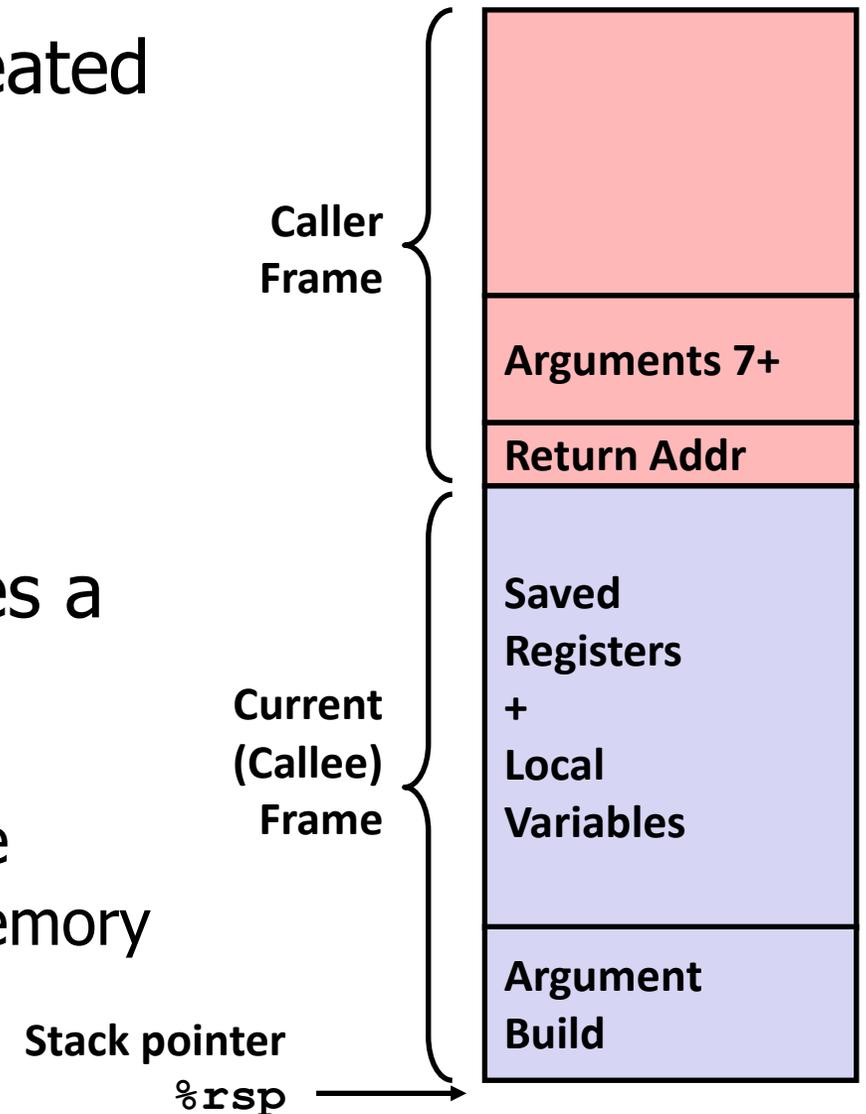

Break + Open Questions

- What are the initial values of variables created on the stack?
- Is there a limit to how many local variables a function can have?

Break + Open Questions

- What are the initial values of variables created on the stack?
 - Undefined behavior in C (compiler chooses)
 - Machine just creates a variable in the stack
 - Initial value is whatever was there before
- Is there a limit to how many local variables a function can have?
 - Based on memory limit of the process
 - Stack keeps growing until it runs out of space
 - OS can do lots of tricks to give it more memory

Outline

- C Code Layout
- x86-64 Calling Convention
- Managing Local Data
- **Register Saving**
 - Recursion Example

Register Saving

- Can a function use `%rdx` for temporary storage?

Caller

```
yo:
    . . .
    movq $15213, %rdx
    call who
    addq %rdx, %rax
    . . .
    ret
```

Callee

```
who:
    . . .
    subq $18213, %rdx
    . . .
    ret
```

- Contents of register `%rdx` overwritten by `who`!
- This could be trouble → something should be done!
 - Need some coordination

Reusing registers

- Problem: registers are shared between functions
 - Callee could overwrite caller's registers by accident
- How does each function know which registers are safe to use?
- Solution:
 - Save original register value to stack
 - Use register as needed
 - Restore original register value from stack
- New question: when should the saving happen? In advance or on demand?

Saving registers in advance

- New question: who should save the registers, Caller or Callee?
- Attempt 1: Save everything in advance
 - Caller knows which registers it is using
 - Save all registers it is going to need after the call
- Downside: Caller doesn't know what Callee needs
 - Wasted stores to memory if Callee doesn't need those registers

Saving registers on demand

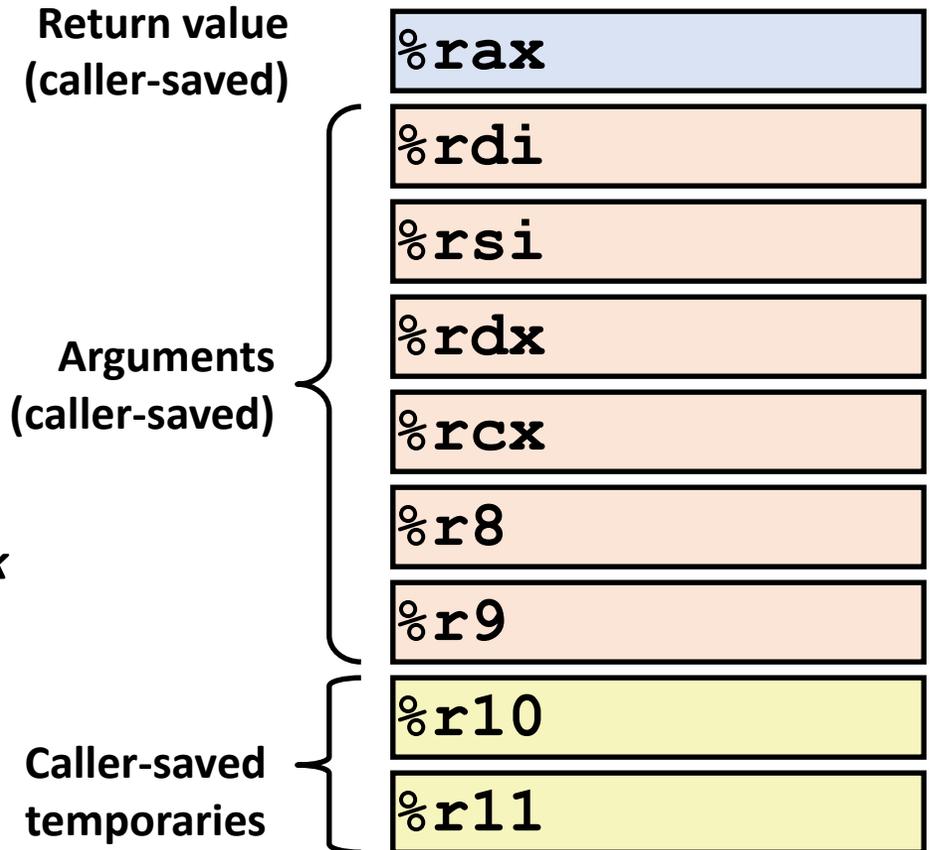

- New question: who should save the registers, Caller or Callee?
- Attempt 2: Save everything on demand
 - Callee knows which registers it is using
 - Save all registers it is going to use at the start of the function
- Downside: Callee doesn't know what Caller was using
 - Wasted stores to memory if Caller wasn't using those registers

Compromise: some registers in advance, some on demand

- Neither the Caller nor the Callee has perfect knowledge of register availability
- Designate based on register which are saved when
 - Some are saved in advance: Caller saved
 - Some are saved on demand: Callee saved
- Remember: Caller and Callee are just designations for one call event
 - Functions can and do act as both at different times

x86-64 Linux Register Usage #1 (caller-saved, in advance)

- **%rax**
 - Return value
 - Caller-saved
 - **Will** be modified by function we're about to call
- **%rdi, ..., %r9**
 - Arguments
 - Caller-saved
 - Can be modified by function we're about to call
 - If more than 6 arguments, then *pass the rest on the stack*
- **%r10, %r11**
 - Caller-saved
 - Can be modified by function we're about to call

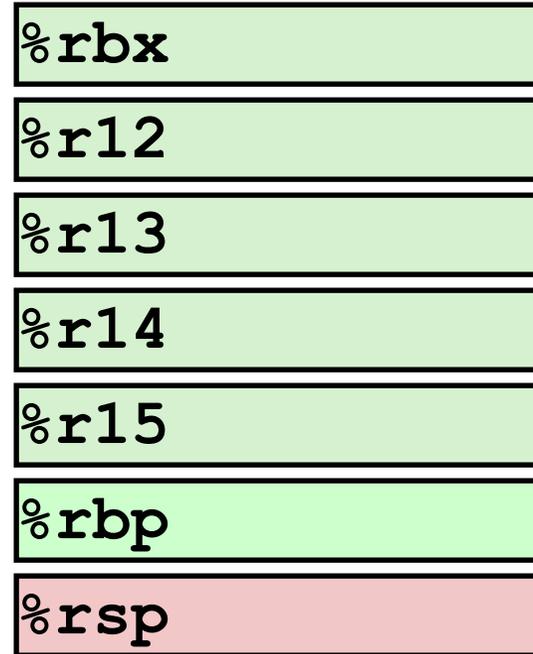

x86-64 Linux Register Usage #2 (callee-saved, on demand)

- **%rbx, %r12, %r13, %r14**

- Callee-saved
- Callee must save & restore

Callee-saved
Temporaries

Special

- **%rsp**

- Special form of callee-saved
- Restored to original value upon exit from procedure
 - Stack frame is removed

x86-64 Integer Registers: Usage Conventions

Caller Saved	In advance
Callee saved	On demand

%rax	Return value
%rbx	Callee saved
%rcx	Argument #4
%rdx	Argument #3
%rsi	Argument #2
%rdi	Argument #1
%rsp	Stack pointer
%rbp	Callee saved

%r8	Argument #5
%r9	Argument #6
%r10	Caller saved
%r11	Caller Saved
%r12	Callee saved
%r13	Callee saved
%r14	Callee saved
%r15	Callee saved

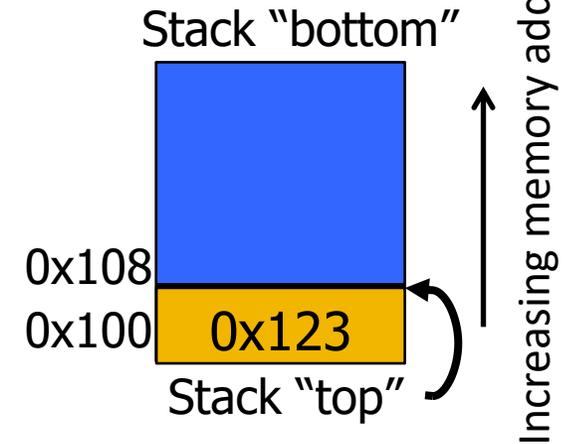

Push and Pop instructions

Instruction	Effect	Description
<code>pushq S</code>	$R[\%rsp] \leftarrow R[\%rsp] - 8;$ $M[R[\%rsp]] \leftarrow S$	Store S onto the stack
<code>popq D</code>	$D \leftarrow M[R[\%rsp]]$ $R[\%rsp] \leftarrow R[\%rsp] + 8;$	Retrieve D from the stack

- Example:

`%rax = 0x123, %rdx = 0x0, %rsp = 0x108`

```
pushq %rax      %rsp = 0x100
popq %rdx       %rdx = 0x123; %rsp = 0x108
```

- Remember, stack is just memory

- Can also use memory moves and modify `%rsp` manually!

Register Saving Example #1

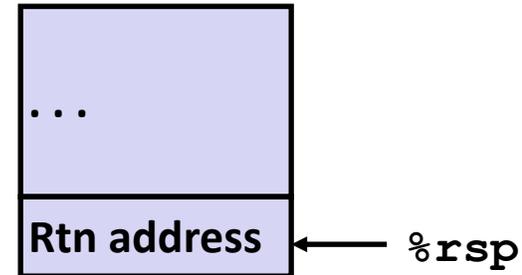

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

↑ Still need **x** after the call!

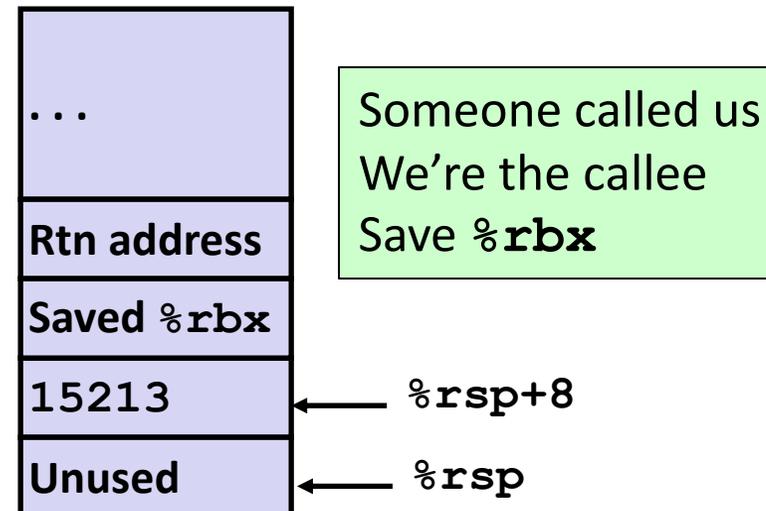

%rbx is callee-save (on demand)

```
call_incr2:  
→ pushq    %rbx  
→ subq     $16, %rsp  
  movq    %rdi, %rbx  
  movq    $15213, 8(%rsp)  
  movq    $3000, %rsi  
  leaq    8(%rsp), %rdi  
  call    incr  
  addq    %rbx, %rax  
  addq    $16, %rsp  
  popq    %rbx  
  ret
```

Initial Stack Structure

Resulting Stack Structure

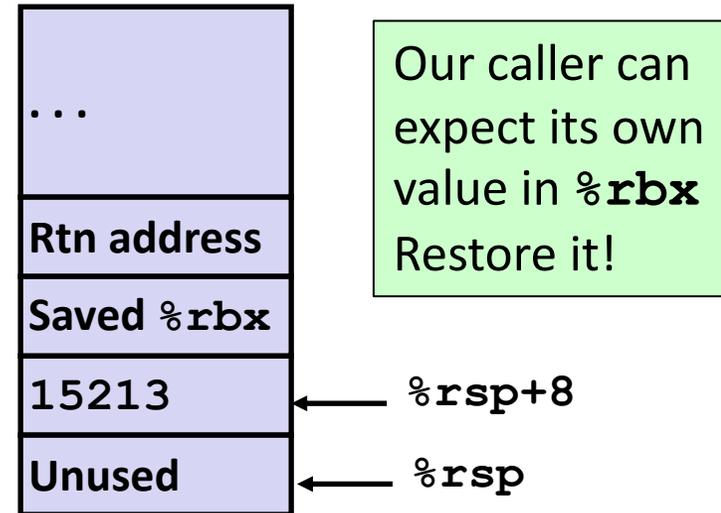

Register Saving Example #2

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

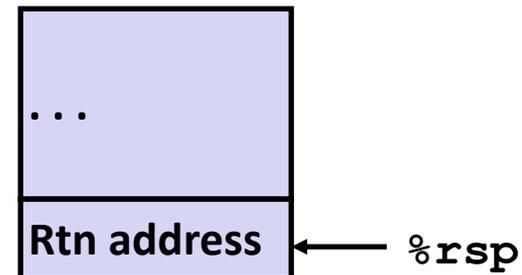

`%rbx` is callee-save (on demand)

```
call_incr2:  
    pushq    %rbx  
    subq    $16, %rsp  
    movq    %rdi, %rbx  
    movq    $15213, 8(%rsp)  
    movq    $3000, %rsi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    %rbx, %rax  
    → addq    $16, %rsp  
    → popq    %rbx  
    ret
```

Resulting Stack Structure

Pre-return Stack Structure

Outline

- C Code Layout
- x86-64 Calling Convention
- Managing Local Data
- **Register Saving**
 - **Recursion Example**

Recursive Function

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movq    $0, %rax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andq    $1, %rbx
    shrq    %rdi # (by 1)
    callq   pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Note: `rep` instruction inserted as no-op. You can ignore it.

Recursive Function Base Case

```
/* Recursive popcount */  
long pcount_r(unsigned long x) {  
→ if (x == 0)  
→ return 0;  
  else  
    return (x & 1)  
        + pcount_r(x >> 1);  
}
```

Register	Use(s)	Type
%rdi	x	Argument
%rax	Return value	Return value

pcount_r:

```
movq    $0, %rax  
testq   %rdi, %rdi  
je      .L6
```

```
pushq   %rbx  
movq    %rdi, %rbx  
andq    $1, %rbx  
shrq    %rdi # (by 1)  
callq   pcount_r  
addq    %rbx, %rax  
popq    %rbx
```

.L6:

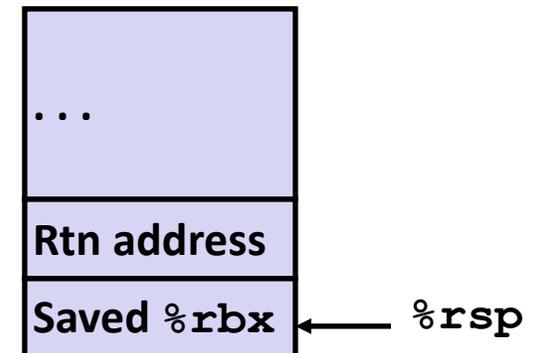

```
rep; ret
```

Recursive Function Register Save

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

Register	Use(s)	Type
%rdi	x	Argument

```
pcount_r:
    movq    $0, %rax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andq    $1, %rbx
    shrq    %rdi # (by 1)
    callq   pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Recursive Function Call Setup

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) ← ↓
                + pcount_r(x >> 1);
}
```

```
pcount_r:
    movq    $0, %rax
    testq   %rdi, %rdi
    je     .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andq    $1, %rbx
    shrq    %rdi # (by 1)
    callq   pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rdi	x >> 1	Rec. argument
%rbx	x & 1	Callee-saved

Recursive Function Call

```
/* Recursive popcount */  
long pcount_r(unsigned long x) {  
    if (x == 0)  
        return 0;  
    else  
        return (x & 1)  
            + pcount_r(x >> 1);  
}
```

```
pcount_r:  
    movq    $0, %rax  
    testq   %rdi, %rdi  
    je     .L6  
    pushq  %rbx  
    movq   %rdi, %rbx  
    andq   $1, %rbx  
    shrq   %rdi # (by 1)  
    callq  pcount_r  
    addq   %rbx, %rax  
    popq   %rbx  
.L6:  
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Recursive call return value	

Recursive Function Result

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

```
pcount_r:
    movq    $0, %rax
    testq   %rdi, %rdi
    je     .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andq    $1, %rbx
    shrq    %rdi # (by 1)
    callq   pcount_r
    addq    %rbx, %rax
    popq    %rbx
.L6:
    rep; ret
```

Register	Use(s)	Type
%rbx	x & 1	Callee-saved
%rax	Return value	

Recursive Function Completion

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

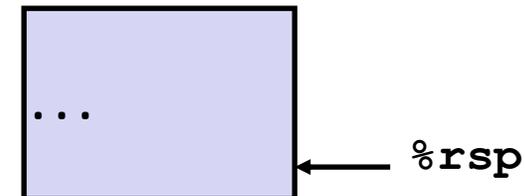

```
pcount_r:
    movq    $0, %rax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andq    $1, %rbx
    shrq    %rdi # (by 1)
    callq   pcount_r
    addq    %rbx, %rax
```

```
popq    %rbx
```

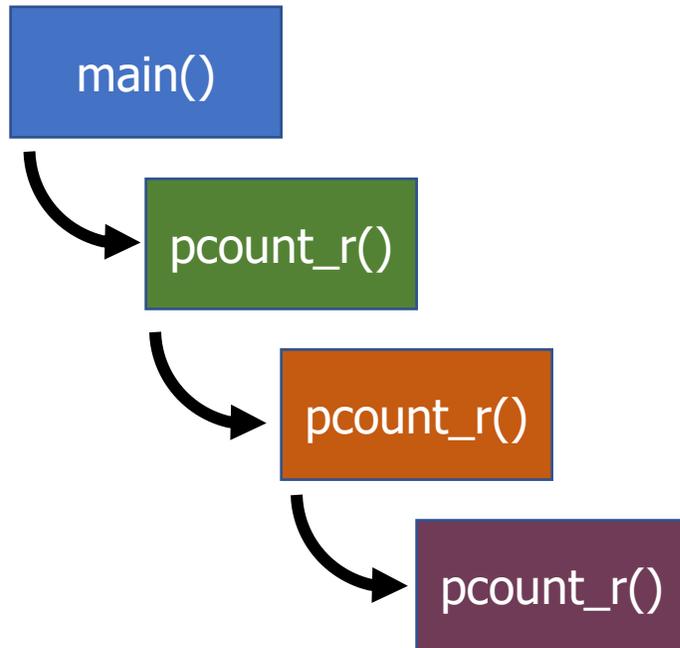

```
.L6:
```

```
rep; ret
```

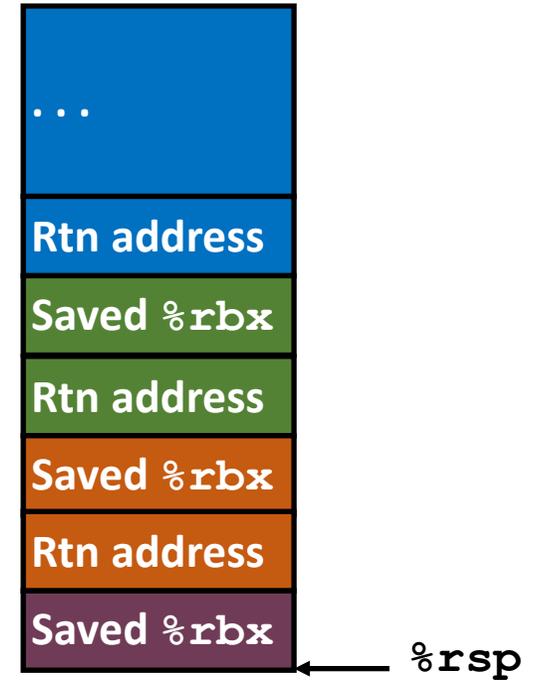

Register	Use(s)	Type
%rax	Return value	Return value

Example three recursions in

Executing, but has not yet called pcount_r() again

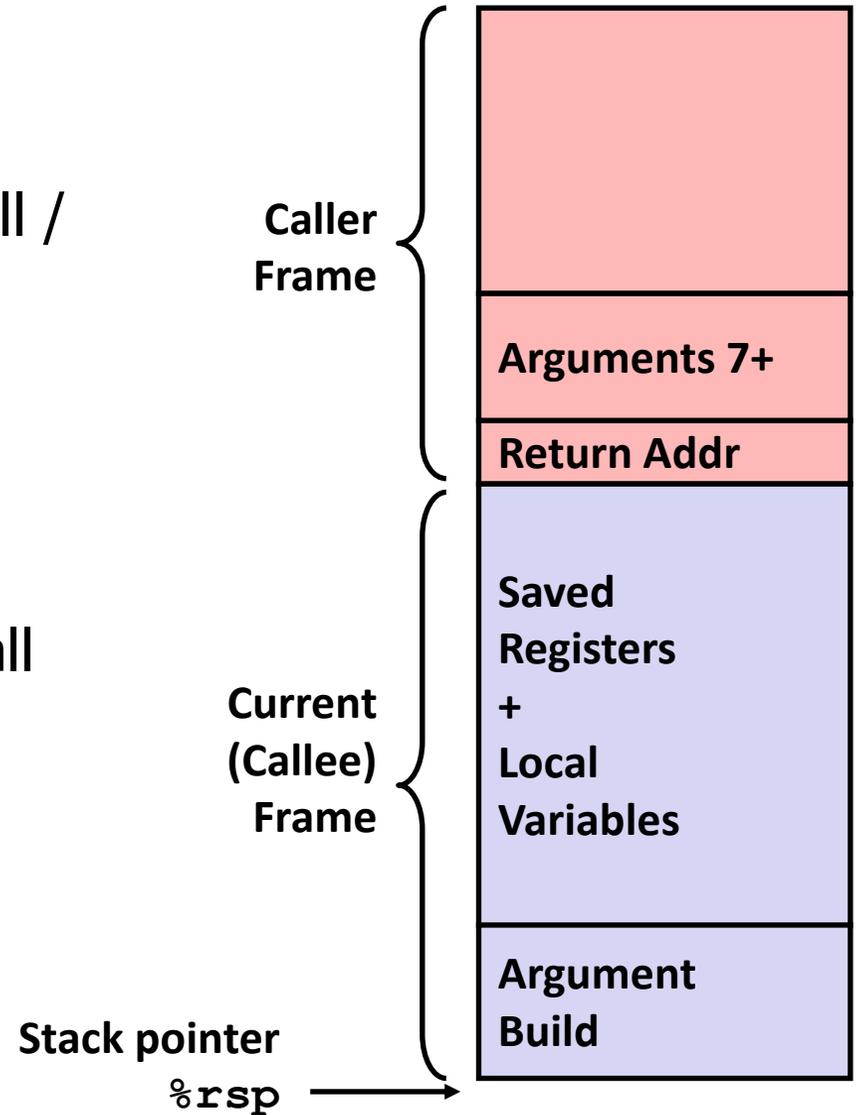

x86-64 Procedure Summary

- Important Points

- A stack is the right data structure for procedure call / return
 - If P calls Q, then Q returns before P
- The stack makes recursion work

- Calling convention

- Caller-saved registers saved **in advance** before call
- Put arguments in registers (1-6)
- Put further arguments on top of stack (7+)
- Put return address on top of stack
- Callee can safely store values in local stack frame and in callee-saved registers (after saving them)
- Result return in `%rax` and restore callee-saved registers before returning

Outline

- C Code Layout
- x86-64 Calling Convention
- Managing Local Data
- Register Saving
 - Recursion Example

Outline

- Bonus: Stack Frame Example

x86-64 Stack Frame Example

```
long sum = 0;
/* Swap a[i] & a[i+1] */
void
swap_ele_su(long a[], int i)
{
    swap(&a[i], &a[i+1]);
    sum += (a[i]*a[i+1]);
}
```

- Keeps values of `&a[i]` and `&a[i+1]` in callee-save registers
- Must set up stack frame to save these registers

```
swap_ele_su:
    movq    %rbx, -16(%rsp)
    movq    %rbp, -8(%rsp)
    subq    $16, %rsp
    movslq  %esi, %rax
    leaq    8(%rdi,%rax,8), %rbx
    leaq    (%rdi,%rax,8), %rbp
    movq    %rbx, %rsi
    movq    %rbp, %rdi
    call   swap
    movq    (%rbx), %rax
    imulq   (%rbp), %rax
    addq    %rax, sum(%rip)
    movq    (%rsp), %rbx
    movq    8(%rsp), %rbp
    addq    $16, %rsp
    ret
```

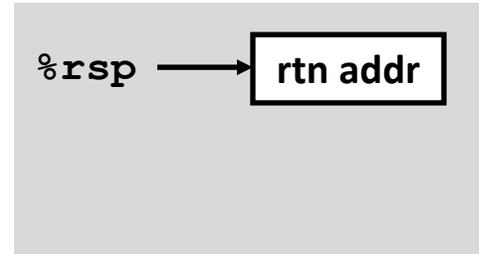

Understanding x86-64 Stack Frame

swap ele su:

```
movq    %rbx, -16(%rsp)    # Save %rbx
movq    %rbp, -8(%rsp)    # Save %rbp
subq    $16, %rsp        # Allocate stack frame
movslq  %esi, %rax        # Extend i
leaq    8(%rdi,%rax,8), %rbx # &a[i+1] (callee save)
leaq    (%rdi,%rax,8), %rbp # &a[i] (callee save)
movq    %rbx, %rsi        # 2nd argument
movq    %rbp, %rdi        # 1st argument
call    swap
movq    (%rbx), %rax      # Get a[i+1]
imulq   (%rbp), %rax      # Multiply by a[i]
addq    %rax, sum(%rip)   # Add to sum
movq    (%rsp), %rbx     # Restore %rbx
movq    8(%rsp), %rbp    # Restore %rbp
addq    $16, %rsp        # Deallocate frame
ret
```

Understanding x86-64 Stack Frame

```
movq    %rbx, -16(%rsp)    # Save %rbx
movq    %rbp, -8(%rsp)     # Save %rbp
```

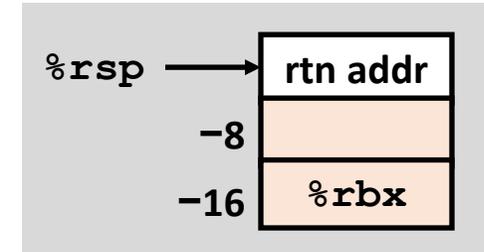

```
subq    $16, %rsp         # Allocate stack frame
```

● ● ●

```
movq    (%rsp), %rbx      # Restore %rbx
movq    8(%rsp), %rbp     # Restore %rbp
addq    $16, %rsp        # Deallocate frame
```

Understanding x86-64 Stack Frame

→ `movq %rbx, -16(%rsp)` # Save %rbx
`movq %rbp, -8(%rsp)` # Save %rbp

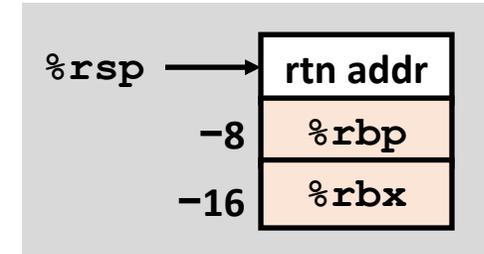

`subq $16, %rsp` # Allocate stack frame

● ● ●

`movq (%rsp), %rbx` # Restore %rbx
`movq 8(%rsp), %rbp` # Restore %rbp
`addq $16, %rsp` # Deallocate frame

Understanding x86-64 Stack Frame

```
→ movq    %rbx, -16(%rsp)    # Save %rbx  
   movq    %rbp, -8(%rsp)    # Save %rbp
```

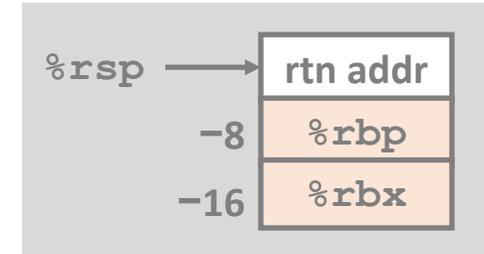

```
